

THE NATURAL AFFINORS ON SOME  
FIBER PRODUCT PRESERVING GAUGE  
BUNDLE FUNCTORS OF VECTOR BUNDLES

JAN KUREK AND WŁODZIMIERZ M. MIKULSKI

*Dedicated to Professor Ivan Kolář on the occasion  
of his 70th birthday with respect and gratitude*

ABSTRACT. We classify all natural affinors on vertical fiber product preserving gauge bundle functors  $F$  on vector bundles. We explain this result for some more known such  $F$ . We present some applications. We remark a similar classification of all natural affinors on the gauge bundle functor  $F^*$  dual to  $F$  as above. We study also a similar problem for some (not all) not vertical fiber product preserving gauge bundle functors on vector bundles.

INTRODUCTION

Let  $m, n$  be fixed positive integers.

The category of vector bundles with  $m$ -dimensional bases and vector bundle maps with embeddings as base maps will be denoted by  $\mathcal{VB}_m$ .

The category of vector bundles with  $m$ -dimensional bases and  $n$ -dimensional fibers and vector bundle embeddings will be denoted by  $\mathcal{VB}_{m,n}$ .

Let  $F : \mathcal{VB}_m \rightarrow \mathcal{FM}$  be a covariant functor. Let  $B_{\mathcal{FM}} : \mathcal{FM} \rightarrow \mathcal{Mf}$  and  $B_{\mathcal{VB}_m} : \mathcal{VB}_m \rightarrow \mathcal{Mf}$  be the base functors.

A gauge bundle functor on  $\mathcal{VB}_m$  is a functor  $F$  as above satisfying:

(i) (*Base preservation*)  $B_{\mathcal{FM}} \circ F = B_{\mathcal{VB}_m}$ . Hence the induced projections form a functor transformation  $\pi : F \rightarrow B_{\mathcal{VB}_m}$ .

(ii) (*Localization*) For every inclusion of an open vector subbundle  $i_{E|U} : E|U \rightarrow E$ ,  $F(E|U)$  is the restriction  $\pi^{-1}(U)$  of  $\pi : FE \rightarrow B_{\mathcal{VB}_m}(E)$  to  $U$  and  $F i_{E|U}$  is the inclusion  $\pi^{-1}(U) \rightarrow FE$ .

(iii) (*Regularity*)  $F$  transforms smoothly parametrized systems of  $\mathcal{VB}_m$ -morphisms into smoothly parametrized families of  $\mathcal{FM}$ -morphisms.

*Key words and phrases*: gauge bundle functors, natural operators, natural transformations, natural affinors, jets.

Received September 29, 2004.

A gauge bundle functor  $F : \mathcal{VB}_m \rightarrow \mathcal{FM}$  is of finite order  $r$  if from  $j_x^r f = j_x^r g$  it follows  $F_x f = F_x g$  for any  $\mathcal{VB}_m$ -objects  $E_1 \rightarrow M$ ,  $E_2 \rightarrow M$ , any  $\mathcal{VB}_m$ -maps  $f, g : E_1 \rightarrow E_2$  and any  $x \in M_1$ .

A gauge bundle functor  $F$  on  $\mathcal{VB}_m$  is fiber product preserving if for any fiber product projections

$$E_1 \xleftarrow{\text{pr}_1} E_1 \times_M E_2 \xrightarrow{\text{pr}_2} E_2$$

in the category  $\mathcal{VB}_m$ ,

$$FE_1 \xleftarrow{F \text{pr}_1} F(E_1 \times_M E_2) \xrightarrow{F \text{pr}_2} FE_2$$

are fiber product projections in the category  $\mathcal{FM}$ . In other words we have  $F(E_1 \times_M E_2) = F(E_1) \times_M F(E_2)$ .

A gauge bundle functor  $F$  on  $\mathcal{VB}_m$  is called vertical if for any  $\mathcal{VB}_m$ -objects  $E \rightarrow M$  and  $E_1 \rightarrow M$  with the same basis, any  $x \in M$  and any  $\mathcal{VB}_m$ -map  $f : E \rightarrow E_1$  covering the identity of  $M$  the fiber restriction  $F_x f : F_x E \rightarrow F_x E_1$  depends only on  $f_x : E_x \rightarrow (E_1)_x$ .

From now on we are interested in vertical fiber product preserving gauge bundle functors on  $\mathcal{VB}_m$ .

The most known example of vertical fiber product preserving gauge bundle functor  $F$  on  $\mathcal{VB}_m$  is the so-called vertical  $r$ -jet prolongation functor  $J_v^r : \mathcal{VB}_m \rightarrow \mathcal{FM}$ , where for a  $\mathcal{VB}_m$ -object  $p : E \rightarrow M$  we have a vector bundle  $J_v^r E = \{j_x^r \gamma \mid \gamma \text{ is a local map } M \rightarrow E_x, x \in M\}$  and for a  $\mathcal{VB}_m$ -map  $f : E_1 \rightarrow E_2$  covering  $\underline{f} : M_1 \rightarrow M_2$  we have a vector bundle map  $J_v^r f : J_v^r E_1 \rightarrow J_v^r E_2$ , where  $J_v^r f(j_x^r \gamma) = j_{\underline{f}(x)}^r (f \circ \gamma \circ \underline{f}^{-1})$  for  $j_x^r \gamma \in J_v^r E_1$ .

Another example is the vertical Weil functor  $V^A$  on  $\mathcal{VB}_m$  corresponding to a Weil algebra  $A$ , where for a  $\mathcal{VB}_m$ -object  $p : E \rightarrow M$  we have  $V^A E = \cup_{x \in M} T^A(E_x)$  and for a  $\mathcal{VB}_m$ -map  $f : E_1 \rightarrow E_2$  we have  $V^A f = \cup_{x \in M_1} T^A(f_x) : V^A E_1 \rightarrow V^A E_2$ . The functor  $V^A$  is equivalent to  $E \otimes A$ .

The fiber product  $F_1 \times_{B\mathcal{VB}_m} F_2 : \mathcal{VB}_m \rightarrow \mathcal{FM}$  of vertical fiber product preserving gauge bundle functors  $F_1, F_2 : \mathcal{VB}_m \rightarrow \mathcal{FM}$  is again a vertical fiber product preserving gauge bundle functor on  $\mathcal{VB}_m$ .

In [8], we proved that every fiber product preserving gauge bundle functor  $F$  on  $\mathcal{VB}_m$  has values in  $\mathcal{VB}_m$ . (More precisely, the fiber sum map  $+$  :  $E \times_M E \rightarrow E$ , the fiber scalar multiplication  $\lambda_t : E \rightarrow E$  for  $t \in \mathbf{R}$  and the zero map  $0 : E \rightarrow E$  are  $\mathcal{VB}_m$ -map and we can apply  $F$ . We obtain  $F(+)$  :  $FE \times_M FE \rightarrow FE$ ,  $F(\lambda_t) : FE \rightarrow FE$  and  $F(0) : FE \rightarrow FE$ . Then  $(F(+), F(\lambda_t), F(0))$  is a vector bundle structure on  $FE$ .) Then we can compose such functors. The composition of vertical fiber product preserving gauge bundle functors on  $\mathcal{VB}_m$  is again a vertical fiber product preserving gauge bundle functor on  $\mathcal{VB}_m$ .

If  $F$  is a vertical fiber product preserving gauge bundle functor on  $\mathcal{VB}_m$ , then  $(F^*)^* : \mathcal{VB}_m \rightarrow \mathcal{FM}$ ,  $(F^*)^*(E) = (FE^*)^*$ ,  $(F^*)^*(f) = (Ff^*)^*$  is a vertical fiber product preserving gauge bundle functor on  $\mathcal{VB}_m$  ( $E^*$  denote the dual vector bundle of  $E$ ).

In [8], we classified all fiber product preserving gauge bundle functors  $F$  on  $\mathcal{VB}_m$  of finite order  $r$  in terms of triples  $(V, H, t)$ , where  $V$  is a finite-dimensional vector space over  $\mathbf{R}$ ,  $H : G_m^r \rightarrow \mathrm{GL}(V)$  is a smooth group homomorphism from  $G_m^r = \mathrm{inv}J_0^r(\mathbf{R}^m, \mathbf{R}^m)_0$  into  $\mathrm{GL}(V)$  and  $t : \mathcal{D}_m^r \rightarrow \mathrm{gl}(V)$  is a  $G_m^r$ -equivariant unity preserving associative algebra homomorphism from  $\mathcal{D}_m^r = J_0^r(\mathbf{R}^m, \mathbf{R})$  into  $\mathrm{gl}(V)$ . Moreover, we proved that all fiber product preserving gauge bundle functors  $F$  on  $\mathcal{VB}_m$  are of finite order. Analyzing the construction on  $(V, H, t)$  one can easily see that the triple  $(V, H, t)$  corresponding to a vertical  $F$  in question has trivial  $t : \mathcal{D}_m^r \rightarrow \mathrm{gl}(V)$ ,  $t(j_x^r \gamma) = \gamma(0) \mathrm{id}$ ,  $j_0^r \gamma \in \mathcal{D}_m^r$ . Then by Fact 5 and Theorem 2 in [8] it follows that all vertical fiber product preserving gauge bundle functors on  $\mathcal{VB}_m$  can be constructed (up to  $\mathcal{VB}_m$ -equivalence) as follows.

Let  $V : \mathcal{M}f_m \rightarrow \mathcal{VB}$  be a vector natural bundle. For any  $\mathcal{VB}_m$ -object  $p : E \rightarrow M$  we put  $F^V E = E \otimes_M VM$  and for any  $\mathcal{VB}_m$ -map  $f : E_1 \rightarrow E_2$  covering  $\underline{f} : M_1 \rightarrow M_2$  we put  $F^V f = f \otimes_{\underline{f}} V \underline{f} : F^V E_1 \rightarrow F^V E_2$ . The correspondence  $F^V : \mathcal{VB}_m \rightarrow \mathcal{FM}$  is a vertical fiber product preserving gauge bundle functor on  $\mathcal{VB}_m$ . (For example, if  $V : \mathcal{M}f_m \rightarrow \mathcal{VB}$  is the natural vector bundle corresponding to the standard  $G_m^r$ -space  $\mathcal{D}_m^r$ , then  $F^V$  is equivalent with  $J_v^r$ . If  $V : \mathcal{M}f_m \rightarrow \mathcal{VB}$  is the trivial vector natural bundle with the standard fiber  $A$ , then  $F^V$  is equivalent to  $V^A$ .)

Let  $F$  be a gauge bundle functor on  $\mathcal{VB}_m$ . A  $\mathcal{VB}_{m,n}$ -natural affinator  $B$  on  $F$  is a system of  $\mathcal{VB}_{m,n}$ -invariant affinors  $B : TFE \rightarrow TFE$  on  $FE$  for any  $\mathcal{VB}_{m,n}$ -object  $E$ . The invariance means that  $B \circ Tff = Tff \circ B$  for any  $\mathcal{VB}_{m,n}$ -map  $f$ .

In the present paper we describe all  $\mathcal{VB}_{m,n}$ -natural affinors  $B$  on vertical fiber product preserving gauge bundle functors  $F$  on  $\mathcal{VB}_m$ . We prove that  $B : TFE \rightarrow TFE$  is of the form

$$B = \lambda \mathrm{Id} + \mathrm{Mod}(A)$$

for a real number  $\lambda$  and a fiber bilinear  $\mathcal{VB}_{m,n}$ -natural transformation  $A : TM \times_M FE \rightarrow FE$ , where  $\mathrm{Mod}(A)$  is the  $\mathcal{VB}_{m,n}$ -natural affinator corresponding to  $A$  (see Example 2) and  $\mathrm{Id}$  is the identity affinator.

In Section 3, we explain this main result for some more known vertical fiber product preserving gauge bundle functors  $F$  on  $\mathcal{VB}_m$ . Thus for  $J_v^r$  we reobtain the result from [15] saying that the vector space of all  $\mathcal{VB}_{m,n}$ -natural affinors on  $J_v^r$  is 2-dimensional.

In Section 4, we remark a similar classification of  $\mathcal{VB}_{m,n}$ -natural affinors on a gauge bundle functor  $F^*$  dual to a vertical fiber product preserving gauge bundle functor  $F$  on  $\mathcal{VB}_m$ .

In Section 5, we remark a similar classification of  $\mathcal{VB}_{m,n}$ -natural affinors for some (not all) not vertical fiber product preserving gauge bundle functors  $F$  on  $\mathcal{VB}_m$  (as the  $r$ -jet prolongation gauge bundle functor  $J^r$  on  $\mathcal{VB}_m$  and the vector  $r$ -tangent gauge bundle functor  $T^{(r)\natural}$  on  $\mathcal{VB}_m$ ). Thus a similar result as the main result for not necessarily vertical  $F$  is very very probably.

Natural affinors can be used to study torsions of connections, see [5]. That is

why they have been classified in many papers, [1] – [4], [6], [8] – [16], e.t.c.

The trivial vector bundle  $\mathbf{R}^m \times \mathbf{R}^n$  over  $\mathbf{R}^m$  with standard fiber  $\mathbf{R}^n$  will be denoted by  $\mathbf{R}^{m,n}$ . The coordinates on  $\mathbf{R}^m$  will be denoted by  $x^1, \dots, x^m$ . The fiber coordinates on  $\mathbf{R}^{m,n}$  will be denoted by  $y^1, \dots, y^n$ .

All manifolds are assumed to be finite dimensional and smooth. Maps are assumed to be smooth, i.e. of class  $\mathcal{C}^\infty$ .

## 1. THE MAIN RESULT

Let  $F$  be a fiber product preserving gauge bundle functor on  $\mathcal{VB}_m$ . We are going to present examples of  $\mathcal{VB}_{m,n}$ -natural affinors on  $F$ .

**Example 1** (*The identity affinor*). For any  $\mathcal{VB}_{m,n}$ -object  $E$  we have the identity map  $\text{Id} : TFE \rightarrow TFE$ . The family  $\text{Id}$  is a  $\mathcal{VB}_{m,n}$ -natural affinor on  $FE$ .

**Example 2.** Suppose we have a family  $A$  of fiber bilinear maps  $A : TM \times FE \rightarrow FE$  covering the identity of  $M$  for any  $\mathcal{VB}_{m,n}$ -object  $E \rightarrow M$  such that  $Ff \circ A = A \circ (T\underline{f} \times_{\underline{f}} Ff)$  for any  $\mathcal{VB}_{m,n}$ -map  $f : E_1 \rightarrow E_2$  covering  $\underline{f} : M_1 \rightarrow M_2$ , i.e. we have a fiber bilinear  $\mathcal{VB}_{m,n}$ -natural transformation  $A : TM \times_M FE \rightarrow FE$ , where  $TM$  is the tangent bundle of  $M$  and  $FE$  is the vector bundle as is explained in Introduction. For any  $\mathcal{VB}_{m,n}$ -object  $p : E \rightarrow M$  we define  $\text{Mod}(A) : TFE \rightarrow TFE$  by

$$\text{Mod}(A)(v) = \frac{d}{dt_0} (y + tA(T\pi(v), y)) \in T_y FY, \quad v \in T_y FE, \quad y \in FE,$$

where  $\pi : FE \rightarrow M$  is the bundle projection. Then  $\text{Mod}(A)$  is a  $\mathcal{VB}_{m,n}$ -natural affinor on  $F$ . We call  $\text{Mod}(A)$  the  $\mathcal{VB}_{m,n}$ -natural affinor on  $F$  corresponding to  $A$  (the modification of  $A$ ).

For example, in the case of  $F = J_v^r$  we have a fiber bilinear  $\mathcal{VB}_{m,n}$ -natural transformation  $A_v^r : TM \times J_v^r E \rightarrow J_v^r E$ ,  $A_v^r(w, j_x^r \sigma) = j_x^r(w\sigma)$ ,  $w \in T_x M$ ,  $x \in M$ ,  $\sigma : M \rightarrow E_x$ ,  $w\sigma \in E_x$  is the differential of  $\sigma$  with respect to  $w$  and  $w\sigma : M \rightarrow E_x$  is the constant map.

The main result of the present paper is the following classification theorem.

**Theorem 1.** *Let  $F$  be a vertical fiber product preserving gauge bundle functor on  $\mathcal{VB}_m$ . Any  $\mathcal{VB}_{m,n}$ -natural affinor  $B$  on  $F$  is the form*

$$B = \lambda \text{Id} + \text{Mod}(A)$$

for some real number  $\lambda$  and some fiber bilinear  $\mathcal{VB}_{m,n}$ -natural transformation  $A : TM \times_M FE \rightarrow FE$ .

Thus for  $F = J_v^r$  we reobtain the result from [15] saying that any  $\mathcal{VB}_{m,n}$ -natural affinor on  $J_v^r$  is a linear combination with real coefficients of the identity affinor and  $\text{Mod}(A_v^r)$  (see Corollary 5 bellow).

We end this section by the following observation.

Let  $F$  be of the form  $F^V$  for some natural vector bundle  $V : \mathcal{M}f_m \rightarrow \mathcal{V}\mathcal{B}$  (see Introduction). Let  $C : TM \times_M VM \rightarrow VM$  be an  $\mathcal{M}f_m$ -natural fiber bilinear transformation. Then we have a  $\mathcal{V}\mathcal{B}_{m,n}$ -natural fiber bilinear transformation  $A^C : TM \times_M F^V E \rightarrow F^V E$ ,

$$A^C(v, e \otimes y) = e \otimes C(v, y),$$

$y \in V_x M$ ,  $e \in E_x$ ,  $v \in T_x M$ ,  $x \in M$ .

**Proposition 1.** *Let  $V : \mathcal{M}f_m \rightarrow \mathcal{V}\mathcal{B}$  be a natural vector bundle. Any  $\mathcal{V}\mathcal{B}_{m,n}$ -natural fiber bilinear transformation  $A : TM \times_M F^V E \rightarrow F^V E$  is of the form  $A^C$  for some  $\mathcal{M}f_m$ -natural fiber bilinear transformation  $C : TM \times_M VM \rightarrow VM$ .*

**Proof of Proposition 1.** By the  $\mathcal{V}\mathcal{B}_{m,n}$ -invariance,  $A$  is determined by the  $\mathcal{M}f_m$ -natural fiber bilinear transformation

$$TM \times_M VM \ni (v, y) \rightarrow \langle A(v, e_1(\pi^T(v)) \otimes y), e_1^*(\pi^T(v)) \rangle \in VM,$$

where  $e_1, \dots, e_n$  is the usual basis of sections of the trivial vector bundle  $M \times \mathbf{R}^n$  and  $e_1^*, \dots, e_n^*$  is the dual basis, and  $\pi^T : TM \rightarrow M$  is the tangent bundle projection.

## 2. PROOF OF THEOREM 1

We fix a basis in the vector space  $F_0\mathbf{R}^{m,n}$ .

*Step 1.* Consider

$$T\pi \circ B : (TF\mathbf{R}^{m,n})_0 \cong \mathbf{R}^m \times F_0\mathbf{R}^{m,n} \times F_0\mathbf{R}^{m,n} \rightarrow T_0\mathbf{R}^m,$$

where  $\pi : FE \rightarrow M$  is the bundle projection. Using the invariance of  $B$  with respect to the fiber homotheties we deduce that  $T\pi \circ B(a, u, v) = T\pi \circ B(a, tu, tv)$  for any  $u, v \in F_0\mathbf{R}^{m,n}$ ,  $a \in \mathbf{R}^m$ ,  $t \neq 0$ . Then  $T\pi \circ B(a, u, v) = T\pi \circ B(a, 0, 0)$  for  $u, v, a$  as above. Then using the invariance of  $B$  with respect to  $C \times \text{id}_{\mathbf{R}^n}$  for linear isomorphisms  $C$  of  $\mathbf{R}^n$  we deduce that  $T\pi \circ B(a, 0, 0) = \lambda a$  for some real number  $\lambda$ . Then replacing  $B$  by  $B - \lambda \text{Id}$  we have  $T\pi \circ B(a, u, v) = 0$  for any  $a, u, v$  as above. Then  $B$  is of vertical type.

*Step 2.* Consider

$$\text{pr}_2 \circ B : (TF\mathbf{R}^{m,n})_0 \cong \mathbf{R}^m \times F_0\mathbf{R}^{m,n} \times F_0\mathbf{R}^{m,n} \rightarrow F_0\mathbf{R}^{m,n},$$

where  $(VF\mathbf{R}^{m,n})_0 \cong F_0\mathbf{R}^{m,n} \times F_0\mathbf{R}^{m,n} \rightarrow F_0\mathbf{R}^{m,n}$  is the projection onto the second (essential) factor. Using the invariance of  $B$  with respect to the fiber homotheties we deduce that  $\text{pr}_2 \circ B(a, tu, tv) = t \text{pr}_2 \circ B(a, u, v)$  for  $a, u, v$  as in Step 1. Then  $\text{pr}_2 \circ B(a, u, v)$  is a system of linear combinations of the coefficients of  $u$  and  $v$  with coefficients being smooth maps in  $a$  because of the homogeneous function theorem. On the other hand, since  $B$  is an affinor,  $\text{pr}_2 \circ B(a, u, v)$  is a

system of linear combinations of the coefficients of  $a$  and  $v$  with coefficients being smooth functions in  $u$ . Then

$$(*) \quad \text{pr}_2 \circ B(a, u, v) = G(a, u) + H(v)$$

for some bilinear map  $G$  and some linear map  $H$ .

Let  $\Phi : \mathbf{R}^{m,n} \rightarrow \mathbf{R}^{m,n}$  be a  $\mathcal{VB}_{m,n}$ -map such that  $\Phi(x, v) = (x, e^{x^1} v)$ ,  $(x, y) \in \mathbf{R}^{m,n}$ . Then  $\Phi$  sends  $\frac{\partial}{\partial x^1}$  into  $\frac{\partial}{\partial x^1} + L$ , where  $L$  is the Liouville vector field on  $\mathbf{R}^{m,n}$ . Then using the invariance of  $B$  with respect to  $\Phi$  we obtain

$$F\Phi(G(e_1, F\Phi^{-1}(v))) = G(e_1, v) + H(v),$$

where  $e_1 = (1, 0, \dots, 0) \in \mathbf{R}^m$ . Since  $F$  is vertical,  $F_0\Phi = \text{id}$ . Hence  $H(v) = 0$ , and

$$\text{pr}_2 \circ B(a, u, v) = G(a, u).$$

Then by the  $\mathcal{VB}_{m,n}$ -invariance of  $B$  we obtain the equivariant condition

$$F_0f(G(a, u)) = G(T_0\underline{f}(a), F_0f(u))$$

for any  $a, u$  as above and any  $\mathcal{VB}_{m,n}$ -map  $f : \mathbf{R}^{m,n} \rightarrow \mathbf{R}^{m,n}$  preserving  $0 \in \mathbf{R}^m$ . Hence there is a  $\mathcal{VB}_{m,n}$ -natural fiber bilinear transformation  $A : TM \times_M FE \rightarrow FE$  corresponding to  $G$ . It is easy to see that  $B = \text{Mod}(A)$ .  $\square$

### 3. APPLICATIONS

Let  $T^{(p,q)} = \otimes^q T^* \otimes \otimes^p T : \mathcal{M}f_m \rightarrow \mathcal{VM}$  be the natural vector bundle of tensor fields of type  $(p, q)$  over  $m$ -manifolds. Let  $F^{(p,r)} = F^{T^{(p,r)}} : \mathcal{VB}_m \rightarrow \mathcal{FM}$ ,  $F^{(p,r)}E = E \otimes_M T^{(p,r)}M$ ,  $F^{(p,q)}f = f \otimes_{\underline{f}} T^{(p,q)}\underline{f}$  be the corresponding vertical fiber product preserving gauge bundle functor (see Introduction).

Suppose that  $C : TM \times_M T^{(p,r)}M \rightarrow T^{(p,q)}M$  is a fiber bilinear  $\mathcal{M}f_m$ -natural transformation. Using the invariance of  $C$  with respect to base homotheties on  $\mathbf{R}^{m,n}$  one can easily deduce that  $C = 0$ . Thus we have the following corollary

**Corollary 1.** *Any  $\mathcal{VB}_{m,n}$ -natural affinor on  $F^{(p,q)}$  as above is a constant multiple of the identity affinor.*

Similarly, any  $\mathcal{M}f_m$ -natural fiber bilinear transformation  $C : TM \times_M M \rightarrow M$ , where  $M$  is treated as the zero vector bundle over  $M$ , is zero. Thus we have

**Corollary 2.** *Any  $\mathcal{VB}_{m,n}$ -natural affinor on the vertical Weil bundle  $V^A$  is a constant multiple of the identity affinor.*

Let  $T^{(r)} = (J^r(\cdot, \mathbf{R})_0)^* : \mathcal{M}f_m \rightarrow \mathcal{VB}$  be the linear  $r$ -tangent bundle functor. Let  $F^{(r)} = F^{T^{(r)}} : \mathcal{VB}_m \rightarrow \mathcal{FM}$  be the corresponding vertical fiber product preserving gauge bundle functor.

Suppose that  $C : TM \times_M T^{(r)}M \rightarrow T^{(r)}M$  is a  $\mathcal{M}f_m$ -natural fiber bilinear transformation. By the rank theorem,  $C$  is determined by the contraction  $\langle C, j_0^r x^1 \rangle : T_0^{(r)}\mathbf{R}^m \rightarrow \mathbf{R}$ . Then using the invariance of  $C$  with respect to the base homotheties one can easily show that this contraction is zero. Then  $C = 0$ . Thus we have

**Corollary 3.** *Any  $\mathcal{VB}_{m,n}$ -natural affinator on  $F^{(r)}$  as above is a constant multiple of the identity one.*

Let  $T^{r*} = J^r(\cdot, \mathbf{R})_0 : \mathcal{M}f_m \rightarrow \mathcal{VB}$  be the  $r$ -cotangent bundle functor. Let  $F^{r*} = F^{T^{r*}} : \mathcal{VB}_m \rightarrow \mathcal{FM}$  be the corresponding vertical fiber product preserving gauge bundle functor.

Suppose that  $C : TM \times_M T^{r*}M \rightarrow T^{r*}M$  is a  $\mathcal{M}f_m$ -natural fiber bilinear transformation. By the rank theorem,  $C$  is determined by the evaluations  $C(v, j_0^r x^1) \in T_0^{r*}\mathbf{R}^m$ , where  $v \in T_0\mathbf{R}^m$ . Then using the invariance of  $C$  with respect to the base homotheties one can easily show that these evaluations are zero. Then  $C = 0$ . Thus we have

**Corollary 4.** *Any  $\mathcal{VB}_{m,n}$ -natural affinator on  $F^{r*}$  as above is a constant multiple of the identity one.*

Let  $E^{r*} = J^r(\cdot, \mathbf{R}) : \mathcal{M}f_m \rightarrow \mathcal{VB}$  be the extended  $r$ -cotangent bundle functor. As we know the corresponding vertical fiber product preserving gauge bundle functor on  $\mathcal{VB}_m$  is equivalent to the vertical  $r$ -jet functor  $J_v^r$  (see Introduction).

Suppose that  $C : TM \times_M E^{r*}M \rightarrow E^{r*}M$  is a  $\mathcal{M}f_m$ -natural fiber bilinear transformation. By the rank theorem,  $C$  is determined by the evaluations  $C(\frac{\partial}{\partial x^1}_0, j_0^r 1) \in E_0^{r*}\mathbf{R}^m$  and  $C(\frac{\partial}{\partial x^1}_0, j_0^r x^1) \in E_0^{r*}\mathbf{R}^m$ . Then using the invariance of  $C$  with respect to the base homotheties one can easily show that the second evaluation is a constant multiple of  $j_0^r 1$  and the first one is zero. Then the vector space of all  $C$  in question is of dimension less or equal to 1. Thus we reobtain

**Corollary 5** ([15]). *Any  $\mathcal{VB}_{m,n}$ -natural affinator on  $J_v^r$  is a linear combination with real coefficients of the identity affinator and the affinator  $\text{Mod}(A_v^r)$ .*

**Corollary 6.** *Let  $F$  be a vertical fiber product preserving gauge bundle functor on  $\mathcal{VB}_m$ . Any  $\mathcal{VB}_{m,n}$ -natural 1-form  $\omega$  on  $F$  is zero.*

**Proof.** Let  $L$  be the Liouville vector field on the vector bundle  $FE$ . Then  $\omega \otimes L$  is a  $\mathcal{VB}_{m,n}$ -natural affinator. Since it is not isomorphic, it is of the form  $\omega \otimes L = \text{Mod}(A)$  for some bilinear  $\mathcal{VB}_{m,n}$ -natural transformation  $A : TM \times_M FE \rightarrow FE$ . Then  $A$  is of the form  $A(v, y) = \lambda(v)y$  for some uniquely (and then  $\mathcal{M}f_m$ -natural) 1-form  $\lambda : TM \rightarrow \mathbf{R}$  on  $M$ . But any such 1-form is zero. Then  $A = 0$ . Then  $\omega = 0$ .

**Corollary 7.** *Let  $F$  be a vertical fiber product preserving gauge bundle functor on  $\mathcal{VB}_m$ . There is no  $\mathcal{VB}_{m,n}$ -natural symplectic structure  $\omega$  on  $F$ .*

**Proof.** Suppose that such  $\omega$  exists. Then  $\omega(L, \cdot)$  is a  $\mathcal{VB}_{m,n}$ -natural 1-form on  $F$ . Then  $\omega(L, \cdot) = 0$  because of Corollary 6. Then  $\omega$  is degenerate. Contradiction.

Quite similarly one can prove

**Corollary 8.** *Let  $F$  be a vertical fiber product preserving gauge bundle functor on  $\mathcal{VB}_m$ . Then there is no  $\mathcal{VB}_{m,n}$ -natural non-degenerate Riemannian tensor field  $g$  on  $F$ .*

## 4. A DUAL VERSION OF THE MAIN RESULT

Let  $F$  be a vertical fiber product preserving gauge bundle functor on  $\mathcal{VB}_m$ . Let  $F^*$  be the dual gauge bundle functor on  $\mathcal{VB}_{m,n}$ ,  $F^*E = (FE)^*$  and  $F^*f = (Ff^{-1})^*$ . Replacing in the proof of Theorem 1  $F$  by  $F^*$  we obtain

**Theorem 1'.** *Let  $F$  be a vertical fiber product preserving gauge bundle functor on  $\mathcal{VB}_m$ . Let  $F^*$  be the dual gauge bundle functor. Any  $\mathcal{VB}_{m,n}$ -natural affinor  $B$  on  $F^*$  is of the form*

$$B = \lambda \text{Id} + \text{Mod}(A^*)$$

for some  $\lambda \in \mathbf{R}$  and some  $\mathcal{VB}_{m,n}$ -natural fiber bilinear transformation  $A : TM \times_M FM \rightarrow FM$ , where  $A^* : TM \times_M F^*E \rightarrow F^*E$  is the  $\mathcal{VB}_{m,n}$ -natural fiber bilinear transformation given by  $A^*(v, \cdot) = (A(v, \cdot))^*$  for any  $v \in TM$ .

## 5. THE NOT NECESSARILY VERTICAL CASE

In our opinion, it is very probably that Theorem 1 holds for (not necessarily vertical) fiber product preserving gauge bundle functors on  $\mathcal{VB}_m$ . For example, in [15] we proved.

**Fact 1** ([15]). *Any  $\mathcal{VB}_{m,n}$ -natural affinor on the  $r$ -jet prolongation functor  $J^r$ , which is a not vertical fiber product preserving gauge bundle functor on  $\mathcal{VB}_m$ , is a constant multiple of the identity affinor.*

The crucial property of  $J^r$  which we used to prove Fact 1 is that any  $\mathcal{VB}_{m,n}$ -natural linear operator lifting linear vector fields from  $E$  to vector fields on  $J^rE$  is a constant multiple of the flow operator.

Replacing in [15]  $J^r$  be an arbitrary fiber product preserving gauge bundle functor  $F$  on  $\mathcal{VB}_m$  we can obtain

**Proposition 2.** *Let  $F$  be a (not necessarily vertical) fiber product preserving gauge bundle functor on  $\mathcal{VB}_m$  such that any  $\mathcal{VB}_{m,n}$ -natural linear operator lifting linear vector fields from  $E$  into vector fields on  $FE$  is a constant multiple of the flow operator  $\mathcal{F}$ . Then any  $\mathcal{VB}_{m,n}$ -natural affinor  $B$  on  $F$  is a constant multiple of the identity affinor.*

**Proof.** Clearly,  $B \circ \mathcal{F}$  is a  $\mathcal{VB}_{m,n}$ -natural linear operator lifting linear vector fields to  $F$ . By the assumption, there is  $\lambda \in \mathbf{R}$  such that  $B \circ \mathcal{F} = \lambda \mathcal{F}$ . Next we use the same proof as the one of Theorem 1 up to the formula (\*). Obviously, after Step 1,  $B$  satisfies  $B(\mathcal{F}X) = 0$  for any linear vector field on  $\mathbf{R}^{m,n}$ . Putting in (\*)  $X = a \frac{\partial}{\partial x^i}$  (i.e.  $(a, u, v) = (a, u, 0)$ ) we get  $G(a, u) = 0$ . Putting  $X = L$ , the Liouville vector field on  $\mathbf{R}^{m,n}$  (i.e.  $(a, u, v) = (0, v, v)$ ) we get  $H(v) = 0$ .

In [7], we proved that the assumption of Proposition 1 is satisfied for the vector  $r$ -tangent gauge bundle functor  $T^{(r)\text{fl}}$  on  $\mathcal{VB}_m$  defined as follows. Given a  $\mathcal{VB}_m$ -object  $p : E \rightarrow M$ ,  $T^{(r)\text{fl}}E = (J_{\text{fl}}^r(E, \mathbf{R})_0)^*$  is the vector bundle over  $M$  dual to  $J_{\text{fl}}^rE = \{j_x^r \gamma \mid \gamma : E \rightarrow \mathbf{R} \text{ is fiber linear, } \gamma_x = 0, x \in M\}$ . For every  $\mathcal{VB}_m$ -map  $f : E_1 \rightarrow E_2$  covering  $\underline{f} : M_1 \rightarrow M_2$ ,  $T^{(r)\text{fl}}f : T^{(r)\text{fl}}E_1 \rightarrow T^{(r)\text{fl}}E_2$

is a vector bundle map covering  $\underline{f}$  such that  $\langle T^{(r)\natural}f(\omega), j_{\underline{f}(x)}^r\xi \rangle = \langle \omega, j_x^r(\xi \circ f) \rangle$ ,  $\omega \in T_x^{(r)\natural}E_1$ ,  $j_{\underline{f}(x)}^r\xi \in J_{\natural}^r(E_2, \mathbf{R})_0$ ,  $x \in M$ . (The correspondence  $T^{(r)\natural}$  is a not vertical fiber product preserving gauge bundle functor on  $\mathcal{VB}_m$ .) Thus we have

**Fact 2.** *Any  $\mathcal{VB}_{m,n}$ -natural affinator on  $T^{(r)\natural}$  is a constant multiple of the identity affinator.*
