

## SLANT HANKEL OPERATORS

S. C. ARORA, RUCHIKA BATRA AND M. P. SINGH

ABSTRACT. In this paper the notion of slant Hankel operator  $K_\varphi$ , with symbol  $\varphi$  in  $L^\infty$ , on the space  $L^2(\mathbb{T})$ ,  $\mathbb{T}$  being the unit circle, is introduced. The matrix of the slant Hankel operator with respect to the usual basis  $\{z^i : i \in \mathbb{Z}\}$  of the space  $L^2$  is given by  $\langle \alpha_{ij} \rangle = \langle a_{-2i-j} \rangle$ , where  $\sum_{i=-\infty}^{\infty} a_i z^i$  is the Fourier expansion of  $\varphi$ . Some algebraic properties such as the norm, compactness of the operator  $K_\varphi$  are discussed. Along with the algebraic properties some spectral properties of such operators are discussed. Precisely, it is proved that for an invertible symbol  $\varphi$ , the spectrum of  $K_\varphi$  contains a closed disc.

## 1. INTRODUCTION

Let  $\varphi = \sum_{i=-\infty}^{\infty} a_i z^i$  be a bounded measurable function on the unit circle  $\mathbb{T}$ . Mark C. Ho in his paper [4] has introduced the notion of slant Toeplitz operator  $A_\varphi$  with symbol  $\varphi$  on the space  $L^2$  and it is defined as follows

$$A_\varphi(z^j) = \sum_{i=-\infty}^{\infty} a_{2i-j} z^i$$

for all  $j$  in  $\mathbb{Z}$ ,  $\mathbb{Z}$  being the set of integers.

Also, it is shown that if  $(\alpha_{ij})$  is the matrix of  $A_\varphi$  with respect to the usual basis  $\{z^i : i \in \mathbb{Z}\}$  of  $L^2$ , then  $\alpha_{ij} = a_{2i-j}$ . Moreover if  $W : L^2 \rightarrow L^2$  be defined as

$$W(z^{2n}) = z^n$$

and

$$W(z^{2n-1}) = 0,$$

for each  $n \in \mathbb{Z}$ , then he has proved that  $A_\varphi = WM_\varphi$ , where  $M_\varphi$  is the multiplication operator induced by  $\varphi$ .

The Hankel operators  $H_\varphi$  are usually defined on the space  $H^2$  but they can be extended to the space  $L^2$  as follows.

*Key words and phrases*: Hankel operators, slant Hankel operators, slant Toeplitz operators.

Received August 28, 2004.

The Hankel operator  $S_\varphi$  on  $L^2$  is defined as

$$S_\varphi(z^j) = \sum_{i=-\infty}^{\infty} a_{-i-j} z^i$$

for all  $j$  in  $\mathbb{Z}$ . Moreover, if  $J : L^2 \rightarrow L^2$  is the reflection operator defined by  $J(f(z)) = f(\bar{z})$ , then we can see here that  $S_\varphi = JM_\varphi$  and  $M_\varphi = JS_\varphi$ .

Motivated by Mark C. Ho, we here in this paper introduce the notion of slant Hankel operator on the space  $L^2$  as follows.

The slant Hankel operator  $K_\varphi$  on  $L^2$  is defined as

$$K_\varphi(z^j) = \sum_{i=-\infty}^{\infty} a_{-2i-j} z^i$$

for all  $j$  in  $\mathbb{Z}$ . That is, if  $\langle \beta_{ij} \rangle$  is the matrix of  $K_\varphi$  with respect to the usual basis  $\{z^i : i \in \mathbb{Z}\}$  of  $L^2$  then  $\beta_{ij} = a_{-2i-j}$ . Therefore if  $A_\varphi$  is the slant Toeplitz operator then we can easily see that  $A_\varphi = JK_\varphi$  and  $K_\varphi = JA_\varphi$ . Moreover, we also observe that  $J$  reduces  $W$  as

$$JW(z^{2n}) = Jz^{2n} = \bar{z}^{2n} \quad JW(z^{2n-1}) = J0 = 0$$

and

$$WJz^{2n} = W\bar{z}^{2n} = \bar{z}^{2n} \quad WJz^{2n-1} = Wz^{-2n+1} = 0.$$

Also

$$JW^*(z^n) = Jz^{2n} = \bar{z}^{2n} = J(z^{2n}) = JW^*z^n.$$

Hence

$$JW = WJ \quad \text{and} \quad JW^* = W^*J.$$

We begin with the following

**Theorem 1.**  $K_\varphi = WS_\varphi$ .

**Proof.** If  $S_\varphi$  is the Hankel operator on  $L^2$  then

$$S_\varphi(z^j) = \sum_{i=-\infty}^{\infty} a_{-i-j} z^i.$$

Therefore,

$$WS_\varphi(z^j) = W\left(\sum_{i=-\infty}^{\infty} a_{-i-j} z^i\right) = \sum_{i=-\infty}^{\infty} a_{-2i-j} z^i = K_\varphi(z^j).$$

This is true for all  $j$  in  $\mathbb{Z}$ . Therefore we can conclude that  $K_\varphi = WS_\varphi$ . From here we can see that  $K_\varphi = WS_\varphi = WJM_\varphi = JWM_\varphi = JA_\varphi$ .  $\square$

As a consequence of the above we can prove the following

**Corollary 2.** A slant Hankel operator  $K_\varphi$  with  $\varphi$  in  $L^\infty$  is a bounded linear operator on  $L^2$  with  $\|K_\varphi\| \leq \|\varphi\|_\infty$ .

**Proof.** Since  $\|K_\varphi\| = \|WS_\varphi\| = \|WJM_\varphi\| \leq \|W\| \|J\| \|M_\varphi\| \leq \|M_\varphi\| = \|\varphi\|_\infty$ . This completes the proof.  $\square$

If we denote  $L_\varphi$ , the compression of  $K_\varphi$  on the space  $H^2$ , then  $L_\varphi$  is defined as

$$L_\varphi f = PK_\varphi f$$

for all  $f$  in  $H^2$ , where  $P$  is the orthogonal projection of  $L^2$  onto  $H^2$ . Equivalently

$$\begin{aligned} L_\varphi &= PK_\varphi | H^2 = PJA_\varphi | H^2 = PJWM_\varphi | H^2 \\ &= PWJM_\varphi | H^2 = PWS_\varphi | H^2 = WPS_\varphi | H^2 = WH_\varphi. \end{aligned}$$

That is  $L_\varphi = WH_\varphi$ , where  $H_\varphi$  is the Hankel operator on  $H^2$ . If  $(\beta_{ij})$  is the matrix of  $K_\varphi$  with respect to the usual basis  $\{z^i : i \in \mathbb{Z}\}$  then this matrix is given by

$$\begin{pmatrix} \vdots & \vdots \\ \dots & a_9 & a_8 & a_7 & a_6 & a_5 & a_4 & \dots \\ \dots & a_7 & a_6 & a_5 & a_4 & a_3 & a_2 & \dots \\ \dots & a_5 & a_4 & a_3 & a_2 & a_1 & a_0 & \dots \\ \dots & a_3 & a_2 & a_1 & a_0 & a_{-1} & a_{-2} & \dots \\ \dots & a_1 & a_0 & a_{-1} & a_{-2} & a_{-3} & a_{-4} & \dots \\ \dots & a_{-1} & a_{-2} & a_{-3} & a_{-4} & a_{-5} & a_{-6} & \dots \\ \vdots & \vdots \end{pmatrix}.$$

The lower right quarter of the matrix is the matrix of  $L_\varphi$ . That is

$$\begin{pmatrix} a_0 & a_{-1} & a_{-2} & \dots \\ a_{-2} & a_{-3} & a_{-4} & \dots \\ a_{-4} & a_{-5} & a_{-6} & \dots \\ \vdots & \vdots & \vdots & \dots \end{pmatrix}.$$

We know obtain a characterization of slant Hankel operator as follows

**Theorem 3.** *A bounded linear operator  $K$  on  $L^2$  is a slant Hankel operator if and only if  $M_{\bar{z}}K = KM_{z^2}$ .*

**Proof.** Let  $K$  be a slant Hankel operator. Then by definition  $K = WS_\varphi$ , for some  $\varphi$  in  $L^\infty$ . Then,

$$\begin{aligned} M_{\bar{z}}K &= M_{\bar{z}}WS_\varphi = WM_{\bar{z}^2}S_\varphi = WM_{\bar{z}^2}JM_\varphi \\ &= WJM_{z^2}M_\varphi = WJM_\varphi M_{z^2} = WS_\varphi M_{z^2} = KM_{z^2}. \end{aligned}$$

Conversely, suppose that  $K$  satisfies  $M_{\bar{z}}K = KM_{z^2}$ . Let  $f$  be in  $L^2$  and let  $\sum_{i=-\infty}^{\infty} b_i z^i$  be its Fourier expansion. Then from the equation  $M_{\bar{z}}K = KM_{z^2}$ , we

get

$$\begin{aligned} K(f(\bar{z}^2)) &= K\left(\sum_{i=-\infty}^{\infty} b_i \bar{z}^{2i}\right) = \sum_{i=-\infty}^{\infty} b_i K M_{\bar{z}^{2i}}(1) \\ &= \sum_{i=-\infty}^{\infty} b_i M_{z^i} K(1) = \sum_{i=-\infty}^{\infty} b_i z^i K(1) = f(z)K(1). \end{aligned}$$

This implies that

$$\|f(z)K(1)\| = \|K(f(\bar{z}^2))\| \leq \|K\| \|f(\bar{z}^2)\| = \|K\| \|f(z)\|.$$

Let  $\varphi_0 = K1$ . Let  $\epsilon > 0$  be any real number and  $A_\epsilon = \{z : |\varphi_0(z)| > \|K\| + \epsilon\}$ . Let  $\chi_{A_\epsilon}$  denote the characteristic function of  $A_\epsilon$ . Then

$$\begin{aligned} \|K(\chi_{A_\epsilon})\|^2 &= \int_{\mathbb{T}} |K(\chi_{A_\epsilon}(z))|^2 d\mu = \int_{A_\epsilon} |K(1)|^2 d\mu = \int_{A_\epsilon} |\varphi_0|^2 d\mu \\ &\geq (\|K\| + \epsilon)^2 \mu(A_\epsilon) = (\|K\| + \epsilon)^2 \|\chi_{A_\epsilon}\|^2. \end{aligned}$$

Therefore if  $\|\chi_{A_\epsilon}\| \neq 0$  then we get  $\|K\| + \epsilon \leq \|K\|$ , a contradiction. Thus  $\|\chi_{A_\epsilon}\| = 0$  and  $\mu(A_\epsilon) = 0$ , where  $\mu$  is the normalized Lebesgue measure on  $\mathbb{T}$ . This is true for all  $\epsilon > 0$ . Hence if  $A = \{z : |\varphi_0| \geq \|K\|\}$  then  $\mu(A) = 0$ . Thus  $|\varphi_0(z)| \leq \|K\|$  a.e. This implies that  $\varphi_0$  is in  $L^\infty$ . Again if we consider

$$\begin{aligned} K(\bar{z}f(\bar{z}^2)) &= K\left(\bar{z} \sum_{i=-\infty}^{\infty} b_i z^{-2i}\right) = K\left(\sum_{i=-\infty}^{\infty} b_i z^{-2i-1}\right) \\ &= \sum_{i=-\infty}^{\infty} b_i K M_{z^{-2i}} M_{\bar{z}} = \sum_{i=-\infty}^{\infty} b_i M_{z^i} K M_{\bar{z}} \\ &= \sum_{i=-\infty}^{\infty} b_i z^i K(\bar{z}) = f(z)K(\bar{z}). \end{aligned}$$

So by the same arguments as above, we can see that  $K\bar{z}$  is also bounded. Let  $\varphi_1 = K\bar{z}$  and let  $\varphi(z) = \varphi_0(\bar{z}^2) + z\varphi_1(\bar{z}^2)$ . Since  $\varphi_0$  and  $\varphi_1$  are bounded, therefore  $\varphi$  is also bounded and hence is in  $L^\infty$ . Now we will show that  $K = WS_\varphi$ . Let  $f$  be in  $L^2$ , then  $f$  can be written as

$$f(z) = f_0(\bar{z}^2) + \bar{z}f_1(\bar{z}^2).$$

This implies that

$$\begin{aligned}
WS_\varphi f &= WJM_\varphi f = WJ(\varphi f) = W(\varphi(\bar{z})f(\bar{z})) \\
&= W[(\varphi_0(z^2) + \bar{z}\varphi_1(z^2))(f_0(z^2) + zf_1(z^2))] \\
&= W[\varphi_0(z^2)f_0(z^2) + \varphi_1(z^2)f_1(z^2)] \\
&\quad \{\text{as } W \text{ eliminates the odd powers of } z\} \\
&= W[\varphi_0(z^2)f_0(z^2)] + W[\varphi_1(z^2)f_1(z^2)] = \varphi_0(z)f_0(z) + \varphi_1(z)f_1(z) \\
&= f_0(z)K1 + f_1(z)K\bar{z} = K(f_0(\bar{z}^2)) + K(\bar{z}f_1(\bar{z}^2)) \\
&= K(f_0(\bar{z}^2) + \bar{z}f_1(\bar{z}^2)) = Kf.
\end{aligned}$$

Hence  $K$  is a slant Hankel operator. This completes the proof.  $\square$

**Corollary 4.** *The set of all slant Hankel operators is weakly closed and hence strongly closed.*

**Proof.** Suppose that for each  $\alpha$ ,  $K_\alpha$  is a slant Hankel operator and  $K_\alpha \rightarrow K$  weakly, where  $\{\alpha\}$  is a net. Then for all  $f, g$  in  $L^2\langle K_\alpha f, g \rangle \rightarrow \langle Kf, g \rangle$ . This implies that

$$\langle M_z K_\alpha M_{z^2} f, g \rangle = \langle K_\alpha z^2 f, \bar{z}g \rangle \rightarrow \langle K z^2 f, \bar{z}g \rangle = \langle M_z K M_{z^2} f, g \rangle$$

Since  $K_\varphi$  is a slant Hankel operator, therefore from its characterization, we have  $M_z K_\alpha M_{z^2} = K_\alpha$  for each  $\alpha$ . Thus  $K = M_z K M_{z^2}$  and so  $K$  is slant Hankel operator. This completes the proof.  $\square$

**Definition :** The slant Hankel matrix is defined as a two way infinite matrix  $(a_{ij})$  such that

$$a_{i-1, j+2} = a_{ij}.$$

This definition gives the characterization of the slant Hankel operator  $K_\varphi$  in terms of its matrix as follows

A necessary and sufficient condition for a bounded linear operator on  $L^2$  to be a slant Hankel operator is that its matrix (with respect to the usual basis  $\{z^i : i \in \mathbb{Z}\}$ ) is a slant Hankel matrix.

The adjoint  $K_\varphi^*$ , of the operator  $K_\varphi$ , is defined by

$$K_\varphi^*(z^j) = \sum_{i=-\infty}^{\infty} \bar{a}_{-2j-i} z^i.$$

That is,  $K_\varphi^* = JA_{\varphi(\bar{z})}^*$ . Moreover if  $J$  is the reflection operator then  $JK_\varphi^*(z^j) = \sum_{i=-\infty}^{\infty} \bar{a}_{-2j+i} z^i$  and therefore  $WJK_\varphi^*(z^j) = \sum_{i=-\infty}^{\infty} \bar{a}_{-2j+2i} z^i$ . That is the matrix of

$WJK_\varphi^*$  is given by

$$\begin{pmatrix} \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \\ \dots & \bar{a}_2 & \bar{a}_0 & \bar{a}_{-2} & \bar{a}_{-4} & \bar{a}_{-6} & \dots \\ \dots & \bar{a}_4 & \bar{a}_2 & \bar{a}_0 & \bar{a}_{-2} & \bar{a}_{-4} & \dots \\ \dots & \bar{a}_6 & \bar{a}_4 & \bar{a}_2 & \bar{a}_0 & \bar{a}_{-2} & \dots \\ \dots & \bar{a}_8 & \bar{a}_6 & \bar{a}_4 & \bar{a}_2 & \bar{a}_0 & \dots \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \end{pmatrix}$$

which is constant on diagonals and therefore is the matrix of the multiplication operator  $M_\psi$  where  $\psi = W(\bar{\varphi}(\bar{z}))$ . This helps us in proving the following

**Theorem 5.**  $K_\varphi$  is compact if and only if  $\varphi = 0$ .

**Proof.** Let  $K_\varphi$  be compact, then  $K_\varphi^*$  is also compact. Since  $W$  and  $J$  are bounded linear operators, therefore  $WJK_\varphi^*$  is also compact. But  $WJK_\varphi^* = W(\bar{\varphi}(\bar{z})) = M_\psi$  where  $\psi = W(\bar{\varphi}(\bar{z}))$ . This implies that  $M_\psi$  is compact and therefore  $\langle \psi, z^n \rangle = 0$  for all  $n$ . That is

$$\langle \psi, z^n \rangle = \langle \bar{\varphi}(\bar{z}), W^* z^n \rangle = \langle \sum \bar{a}_i z^i, z^{2n} \rangle = \bar{a}_{2n} = 0.$$

On the other hand, since  $K_\varphi M_{\bar{z}}$  is also compact and therefore

$$\begin{aligned} WJ(K_\varphi M_{\bar{z}})^* &= WJ(JA_\varphi M_{\bar{z}})^* = WJ(JWM_{\varphi\bar{z}})^* \\ &= WJ(K_{\varphi\bar{z}})^* = M_{\psi_0}. \end{aligned}$$

where  $\psi_0 = W(z\bar{\varphi}(\bar{z}))$ , is also compact. This further yields that for each  $n$  in  $\mathbb{Z}$

$$\begin{aligned} 0 &= \langle \psi_0, z^n \rangle = \langle W(\bar{\varphi}(\bar{z})z), z^n \rangle = \langle \bar{\varphi}(\bar{z})z, z^{2n} \rangle \\ &= \left\langle \sum_{i=-\infty}^{\infty} \bar{a}_i z^{i+1}, z^{2n} \right\rangle = \left\langle \sum_{i=-\infty}^{\infty} \bar{a}_{i-1} z^i, z^{2n} \right\rangle = \bar{a}_{2n-1}. \end{aligned}$$

Thus  $a_i = 0$  for all  $i$  which concludes that  $\varphi = 0$ . This completes the proof.  $\square$

The next result deals with the norm of  $K_\varphi$  as follows

**Theorem 5.**  $\|K_\varphi\| = \|A_\varphi\| = \sqrt{\|W|\varphi|^2\|_\infty}$ .

**Proof.** Consider,

$$\begin{aligned} K_\varphi K_\varphi^* &= JA_\varphi(JA_\varphi)^* = JWM_\varphi(JWM_\varphi)^* = JWM_\varphi M_{\bar{\varphi}} W^* J^* \\ &= JWM_{|\varphi|^2} W^* J^* = WJ(JWM_{|\varphi|^2})^* = WJK_{|\varphi|^2}^* = M_\psi \end{aligned}$$

where  $\psi = W(|\varphi|^2)$ . It follows that

$$\|K_\varphi\|^2 = \|K_\varphi K_\varphi^*\| = \|M_\psi\| = \|\psi\|_\infty = \|W|\varphi|^2\|_\infty = \|A_\varphi\|^2.$$

This completes the proof.  $\square$

2. SPECTRUM OF  $K_\varphi$ 

In [4] Mark C. Ho has proved that the spectrum of slant Toeplitz operator contains a closed disc, for any invertible  $\varphi$  in  $L^\infty(\mathbb{T})$ . The same is true for slant Hankel operator. We begin with the following

**Lemma 6.** *If  $\varphi$  is invertible in  $L^\infty$ , then  $\sigma_p(K_\varphi) = \sigma_p(K_{\varphi(\bar{z}^2)})$ , where  $\sigma_p(K_\varphi)$  denotes the point spectrum of  $K_\varphi$ .*

**Proof.** Let  $\lambda \in \sigma_p(K_\varphi)$ . Therefore there exists a non zero  $f$  in  $L^2$  such that  $K_\varphi f = \lambda f$ . Consider  $F = \varphi f$ . Then

$$\begin{aligned} K_{\varphi(\bar{z}^2)}F &= K_{\varphi(\bar{z}^2)}\varphi f = JA_{\varphi(\bar{z}^2)}(\varphi f) = JWM_{\varphi(\bar{z}^2)}\varphi f = JM_{\varphi(\bar{z})}WM_{\varphi}f \\ &= M_{\varphi(z)}JA_{\varphi}f = \varphi(z)K_{\varphi}(f) = \varphi\lambda f = \lambda\varphi f = \lambda F. \end{aligned}$$

Since  $\varphi$  is invertible and  $f \neq 0$ , therefore  $F \neq 0$  and hence  $\lambda \in \sigma_p(K_{\varphi(\bar{z}^2)})$ . This implies that  $\sigma_p(K_\varphi) \subset \sigma_p(K_{\varphi(\bar{z}^2)})$ .

Conversely, let  $\mu \in \sigma_p(K_{\varphi(\bar{z}^2)})$ . Thus there exists some  $0 \neq g$  in  $L^2$  such that  $K_{\varphi(\bar{z}^2)}g = \mu g$ . Let  $G = \varphi^{-1}g$ . This gives that

$$\begin{aligned} K_{\varphi}G &= K_{\varphi}(\varphi^{-1}g) = JA_{\varphi}(\varphi^{-1}g) = JWM_{\varphi}(\varphi^{-1}g) = WJ(\varphi\varphi^{-1}g) = WJg \\ &= \varphi^{-1}\varphi WJg = \varphi^{-1}WJ\varphi(\bar{z}^2)g = \varphi^{-1}K_{\varphi(\bar{z}^2)}g \\ &= \varphi^{-1}\mu g = \mu\varphi^{-1}g = \mu G. \end{aligned}$$

By the same reasons  $\varphi$  is invertible,  $g \neq 0$ , we must have  $G \neq 0$  and therefore the result follows.  $\square$

**Lemma 7.**  *$\sigma(K_\varphi) = \sigma(K_{\varphi(\bar{z}^2)})$  for any  $\varphi$  in  $L^\infty$ , where  $\sigma(K_\varphi)$  denotes the spectrum of  $K_\varphi$ .*

**Proof.** We know the if  $A$  and  $B$  are two bounded linear operators then

$$\sigma(AB) \cup \{0\} = \sigma(BA) \cup \{0\}.$$

Consider

$$K_\varphi^* = (JA_\varphi)^* = A_\varphi^*J^* = M_{\bar{\varphi}}W^*J^* = M_{\bar{\varphi}}(JW)^*.$$

Therefore,

$$\sigma(K_\varphi^*) \cup \{0\} = \sigma[(M_{\bar{\varphi}})(JW)^*] \cup \{0\} = \sigma[(JW)^*(M_{\bar{\varphi}})] \cup \{0\}$$

Again since,

$$\begin{aligned} (JW)^*M_{\bar{\varphi}} &= W^*J^*M_{\bar{\varphi}(z)} = W^*M_{\bar{\varphi}(\bar{z})}J^* = M_{\bar{\varphi}(\bar{z}^2)}W^*J^* \\ &= (WM_{\varphi(\bar{z}^2)})^*J^* = A_{\varphi(\bar{z}^2)}^*J^* = K_{\varphi(\bar{z}^2)}^*. \end{aligned}$$

So,

$$\sigma(K_\varphi^*) \cup \{0\} = \sigma(K_{\varphi(\bar{z}^2)}^*) \cup \{0\}.$$

This gives that

$$\sigma(K_\varphi) \cup \{0\} = \overline{\sigma(K_\varphi^*)} \cup \{0\} = \overline{\sigma(K_{\varphi(\bar{z}^2)}^*)} \cup \{0\} = \sigma(K_{\varphi(\bar{z}^2)}) \cup \{0\}.$$

We assert the  $0 \in \sigma_p(K_{\varphi(\bar{z}^2)})$ . We can see that  $R(W^*) =$  the range of  $W^* = P_e(L^2) =$  the closed linear span of  $\{z^{2n} : n \in \mathbb{Z}\}$  in  $L^2 \neq L^2$ . Hence  $W^*$  is

not onto. This gives that  $\overline{R(W^*J^*M_{\overline{\varphi}})} \neq L^2$ . As  $W^*L^*M_{\overline{\varphi}} = K_{\varphi(\overline{z^2})}^*$ , therefore  $\ker K_{\varphi(\overline{z^2})} \neq 0$ . This implies that  $0 \in \sigma_p(K_{\varphi(\overline{z^2})})$ . If  $\varphi$  is invertible in  $L^\infty$ , then by the above Lemma  $0 \in \sigma_p(K_\varphi)$  and we are done.

Let  $\varphi$  be not invertible in  $L^\infty$ . As the set  $\{\varphi \in L^\infty : \varphi^{-1} \in L^\infty\}$  is dense in  $L^\infty$  [4], therefore we can have a sequence  $\{\varphi_n\}$  of invertible functions such that  $\|\varphi_n - \varphi\| \rightarrow 0$  as  $n \rightarrow \infty$ . Since  $\varphi_n$  is invertible for each  $n$ , therefore  $0 \in \sigma_p(K_{\varphi_n})$  for each  $n$ . Hence for each  $n$  we can find  $f_n \neq 0$  such that  $K_{\varphi_n}f_n = 0$ . Without loss of generality, we can assume that  $\|f_n\| = 1$ . Now

$$\begin{aligned} \|K_\varphi f_n\| &= \|K_\varphi f_n - K_{\varphi_n} f_n + K_{\varphi_n} f_n\| \\ &\leq \|K_\varphi f_n - K_{\varphi_n} f_n\| + \|K_{\varphi_n} f_n\| \leq \|\varphi - \varphi_n\| \rightarrow 0 \end{aligned}$$

as  $n \rightarrow \infty$ . Hence  $0 \in \Pi(K_\varphi)$ , the approximate point spectrum of  $K_\varphi$  and hence is in the spectrum of  $K_\varphi$ . Also 0 is in the approximate point spectrum of  $K_{\varphi(\overline{z^2})}$ . This completes the proof.  $\square$

**Theorem 8.** *The spectrum of  $K_\varphi$  contains a closed disc, for any invertible  $\varphi$  in  $L^\infty(\mathbb{T})$ .*

**Proof.** Let  $\lambda \neq 0$  and suppose that  $K_{\varphi(\overline{z^2})}^* - \lambda$  is onto. For  $f$  in  $L^2(\mathbb{T})$ , we have

$$\begin{aligned} (K_{\varphi(\overline{z^2})}^* - \lambda)f &= K_{\varphi(\overline{z^2})}^* f - \lambda f = M_{\overline{\varphi(\overline{z^2})}}^* W^* J^* f - \lambda f \\ &= \overline{\varphi(\overline{z^2})} f(\overline{z^2}) - \lambda(P_e f \oplus P_0 f) = (W^* J^*(\overline{\varphi} f) - \lambda P_e f) \oplus (-\lambda P_0 f) \\ &= (J^* W^*(\overline{\varphi} f) - \lambda P_e f) \oplus (-\lambda P_0 f) = (J^* W^* \overline{\varphi} - \lambda P_e) f \oplus (-\lambda P_0 f) \\ &= \lambda J^* W^* M_{\overline{\varphi}}(\lambda^{-1} - M_{\overline{\varphi}^{-1}} J W) f \oplus (-\lambda P_0 f) \end{aligned}$$

where  $P_0 = I - P_e$ , that is  $P_0 = \{z^{2k-1} : k \in \mathbb{Z}\}$ . Let  $0 \neq g_0$  be in  $P_0(L^2)$ . Since  $K_{\varphi(\overline{z^2})}^* - \lambda$  is onto, there exists a non zero vector  $f$  in  $L^2(\mathbb{T})$  such that  $(K_{\varphi(\overline{z^2})}^* - \lambda)f = g_0$ . That is,

$$\lambda J^* W^* M_{\overline{\varphi}}(\lambda^{-1} - M_{\overline{\varphi}^{-1}} J W) f \oplus (-\lambda P_0 f) = g_0.$$

Since  $g_0 \in P_0(L^2)$  and  $g_0 \neq 0$ , therefore, we must have

$$\lambda J^* W^* M_{\overline{\varphi}}(\lambda^{-1} - M_{\overline{\varphi}^{-1}} J W) f = 0.$$

Since  $\lambda \neq 0$ ,  $W^*$  and  $J^*$  are isometries and  $M_{\overline{\varphi}}$  being invertible, this implies that

$$(\lambda^{-1} - M_{\overline{\varphi}^{-1}} J W) f = 0.$$

Since  $M_{\overline{\varphi}^{-1}} J W = K_{\overline{\varphi}^{-1}(z^2)}$ , therefore we have

$$(\lambda^{-1} - K_{\overline{\varphi}^{-1}(z^2)}) f = 0.$$

Thus  $\lambda^{-1} \in \sigma_p(K_{\overline{\varphi}^{-1}(z^2)})$ . Now let  $\lambda \in \rho(K_{\varphi(\overline{z^2})}^*)$ , the resolvent of  $K_{\varphi(\overline{z^2})}^*$ , the operator  $K_{\varphi(\overline{z^2})}^* - \lambda$  is invertible and hence onto, therefore,  $\lambda^{-1} \in \sigma_p(K_{\overline{\varphi}^{-1}(z^2)})$ . That is

$$D = \{\lambda^{-1} : \lambda \in \rho(K_{\varphi(\overline{z^2})}^*)\} \subseteq \sigma_p(K_{\overline{\varphi}^{-1}(z^2)}).$$

By Lemma 7, we get  $D \subseteq \sigma_p(K_{\overline{\varphi}^{-1}})$ . So replacing  $\overline{\varphi}^{-1}$  by  $\varphi$ , we get that  $D \subseteq \sigma_p(K_\varphi) \subset \sigma(K_\varphi)$  and therefore we have proved that for any invertible  $\varphi$  in  $L^\infty$ , the

spectrum of  $K_\varphi$  contains a disc consisting of eigenvalues of  $K_\varphi$ . Since spectrum of any operator is compact, it follows that  $\sigma(K_\varphi)$  contains a closed disc.  $\square$

**Remark 1.** The radius of the closed disc contained in  $\sigma(K_\varphi)$  is  $(r(K_{\overline{\varphi^{-1}}}))^{-1}$ , where  $r(A)$  denote the spectral radius of the operator  $A$ . For,

$$\begin{aligned} \max\{|\lambda^{-1}| : \lambda \in \rho(K_{\varphi(\overline{z^2})}^*)\} &= [\{|\lambda| : \lambda \in \rho(K_{\varphi(\overline{z^2})}^*)\}]^{-1} \\ &= [r(K_{\varphi(\overline{z^2})}^*)]^{-1} = [r(K_{\varphi(\overline{z^2})})]^{-1}. \end{aligned}$$

Replacing  $\varphi$  by  $\varphi^{-1}$  we get that the radius of the disc is  $(r(K_{\varphi(\overline{z^2})}))^{-1}$  and therefore

$$r(K_\varphi) \geq (r(K_{\overline{\varphi^{-1}}}))^{-1}.$$
