# SIMPLE PROOFS OF THREE HOMOGENEOUS CYCLIC INEQUALITIES OF THREE VARIABLES OF DEGREE THREE AND FOUR 

SHI-CHANG SHI AND YU-DONG WU

#### Abstract

In this short note, the authors give simple proofs of three homogeneous cyclic inequalities of three variables of degree three and four which were proved quite complicated in [1].

## 1. Introduction and Main Results

Throughout this paper, we will customarily use the cyclic sum and product symbols, that is:

$$
\begin{gathered}
\sum f(x)=f(x)+f(y)+f(z) \\
\sum f(y, z)=f(x, y)+f(y, z)+f(z, x)
\end{gathered}
$$

and

$$
\prod f(x)=f(x) f(y) f(z)
$$

T. Ando obtained the following results in [1].

Theorem 1.1. For non-negative real numbers $x, y, z$ and any real number $t$, the following inequality holds:

$$
\begin{gather*}
t^{2} \sum x^{3}+\left(t^{4}-2 t\right) \sum x^{2} y \geq\left(2 t^{3}-1\right) \sum x y^{2}  \tag{1.1}\\
+\left(3 t^{4}-6 t^{3}+3 t^{2}-6 t+3\right) \prod x .
\end{gather*}
$$

The equality holds if and only if $x=y=z$ or $x: y: z=t: 0: 1$ or any cyclic permutation thereof.
Theorem 1.2. (1) For any real numbers $x, y, z$ and $t$ such that $|t| \geq 2$, the following inequalities hold:

$$
\begin{equation*}
\sum x^{4}+\frac{t^{2}+8}{4} \sum y^{2} z^{2}+\frac{t(t-2)}{2} \sum x \cdot \prod x \geq t \sum x y\left(x^{2}+y^{2}\right) \tag{1.2}
\end{equation*}
$$

[^0]Here, the equality holds if and only if $2 \sum x^{2}=t \sum y z$.
(2) For any non-negative real numbers $x, y, z$ and $t$, the following inequality holds:

$$
\begin{align*}
2 t^{3} \sum x^{4} \geq & t^{2}\left(3-t^{4}\right) \sum x^{3} y+\left(3 t^{4}-1\right) \sum x y^{3} \\
& +\left(t^{6}-3 t^{4}+2 t^{3}-3 t^{2}+1\right) \sum x \cdot \prod x . \tag{1.3}
\end{align*}
$$

The equality holds if and only if $x=y=z$ or $x: y: z=t: 0: 1$ or any cyclic permutation thereof.

In the next two sections, the authors will prove inequalities (1.1)-(1.3) with simple methods. And we will also point out that inequality (1.2) holds for any real number $t$.

## 2. The Proof of Theorem 1.1

Proof. (i) While $x=y=z$, the inequality (1.1) holds obviously.
(ii) While

$$
\begin{equation*}
(x-y)^{2}+(y-z)^{2}+(z-x)^{2} \neq 0 \tag{2.1}
\end{equation*}
$$

we set

$$
\begin{aligned}
m & =\sum x^{2} y-3 \prod x \\
n & =\sum x y^{2}-3 \prod x \\
p & =\sum x^{3}-3 \prod x
\end{aligned}
$$

It's easy to find that $m, n, p>0$ by $A M-G M$ inequality and (2.1). Inequality (1.1) is equivalent to

$$
m t^{4}-2 n t^{3}+p t^{2}-2 m t+n \geq 0
$$

or

$$
\begin{equation*}
m t^{2}\left(t-\frac{n}{m}\right)^{2}+n\left(1-\frac{m}{n} t\right)^{2}+\left[p-\left(\frac{n^{2}}{m}+\frac{m^{2}}{n}\right)\right] t^{2} \geq 0 \tag{2.2}
\end{equation*}
$$

For

$$
\begin{equation*}
p-\left(\frac{n^{2}}{m}+\frac{m^{2}}{n}\right)=\frac{x y z\left[\sum(y-z)^{2}\right]^{3}}{8 m n} \geq 0 \tag{2.3}
\end{equation*}
$$

inequality (2.2) holds, i.e. inequality (1.1) holds.
From (i) and (ii), we complete the proof of inequality (1.1).

## 3. The Proof of Theorem 1.2

### 3.1. The Proof of Inequality (1.2).

Proof. Inequality (1.2) is equivalent to

$$
\begin{equation*}
\frac{1}{4}\left[2\left(x^{2}+y^{2}+z^{2}\right)-t(x y+y z+z x)\right]^{2} \geq 0 \tag{3.1}
\end{equation*}
$$

Inequality (3.1) holds obviously, hence, inequality (1.2) holds.
Remark 1. It's easy to find that inequality (3.1) holds for any real numbers $x, y, z, t$.
3.2. The Proof of Inequality (1.3). In order to prove inequality (1.3), we require the following lemma.

Lemma 1. If $x, y, z \geq 0$, then

$$
\begin{align*}
\sum x^{7} & -\sum(y+z) x^{6}-\sum\left(y^{2}+z^{2}\right) x^{5}+\sum\left(y^{3}+z^{3}\right) x^{4} \\
& +\sum y z(y+z) x^{4}+\prod x \cdot \sum x^{4}-\prod x \cdot \sum y^{2} z^{2}  \tag{3.2}\\
& -\prod x^{2} \cdot \sum x \geq 0 .
\end{align*}
$$

Proof. For inequality (3.2) is symmetric with $x, y, z$, there is no harm in supposing $x \leq y \leq z$, and take $y=x+a, z=x+a+b(a, b \geq 0)$, then inequality (3.2) is equivalent to

$$
\begin{align*}
& 4\left(b^{2}+a b+a^{2}\right)^{2} x^{3}+2(2 a+b)\left(b^{2}+a b+a^{2}\right)\left(4 b^{2}+a b+a^{2}\right) x^{2} \\
& \quad+\left(19 b^{2} a^{4}+39 b^{4} a^{2}+5 b^{6}+23 b^{5} a+33 a^{3} b^{3}+3 b a^{5}+a^{6}\right) x  \tag{3.3}\\
& \quad+b^{2}(2 a+b)\left(b^{4}+4 a b^{3}+6 a^{2} b^{2}+4 a^{3} b+2 a^{4}\right) \geq 0
\end{align*}
$$

For $x \geq 0$ and $a, b \geq 0$, inequality (3.3) holds true. Hence, the proof of inequality (3.2) is complete.

Proof. (i) While $x=y=z$, the inequality (1.3) holds obviously.
(ii) While $(x-y)^{2}+(y-z)^{2}+(z-x)^{2} \neq 0$, then we set

$$
\begin{aligned}
& u=\sum x^{3} y-\prod x \sum x, \\
& v=\sum x y^{3}-\prod x \sum x \\
& w=\sum x^{4}-\prod x \sum x
\end{aligned}
$$

It's easy to find that $u, v, w>0$ by sequence inequality and (2.1). Inequality (1.3) is equivalent to

$$
u t^{6}-3 v t^{4}+2 w t^{3}-3 u t^{2}+v \geq 0
$$

or

$$
\begin{align*}
\frac{(t \sqrt{u}+2 \sqrt{v})(t \sqrt{u}-\sqrt{v})^{2} t^{3}}{\sqrt{u}} & +\frac{(\sqrt{v}+2 t \sqrt{u})(\sqrt{v}-t \sqrt{u})^{2}}{\sqrt{v}}  \tag{3.4}\\
& +2\left[w-\left(v \sqrt{\frac{v}{u}}+u \sqrt{\frac{u}{v}}\right)\right] t^{3} \geq 0
\end{align*}
$$

And by Lemma 1, we have

$$
\begin{aligned}
& u v w^{2}-\left(u^{2}+v^{2}\right)^{2} \\
= & \frac{1}{4} x y z(x+y+z)^{2}\left[\sum(y-z)^{2}\right]^{2} \cdot\left[\sum x^{7}-\sum(y+z) x^{6}\right. \\
& -\sum\left(y^{2}+z^{2}\right) x^{5}+\sum\left(y^{3}+z^{3}\right) x^{4}+\sum y z(y+z) x^{4} \\
& \left.+\prod x \cdot \sum x^{4}-\prod x \cdot \sum y^{2} z^{2}-\prod x^{2} \cdot \sum x\right] \geq 0,
\end{aligned}
$$

hence,

$$
\begin{aligned}
w-\left(v \sqrt{\frac{v}{u}}+u \sqrt{\frac{u}{v}}\right) & =\frac{\sqrt{u v} w-\left(u^{2}+v^{2}\right)}{\sqrt{u v}} \\
& =\frac{u v w^{2}-\left(u^{2}+v^{2}\right)^{2}}{\sqrt{u v}\left[\sqrt{u v} w+\left(u^{2}+v^{2}\right)\right]} \geq 0 .
\end{aligned}
$$

For $t \geq 0$, inequality (3.4) holds obviously, i.e. inequality (1.3) holds. From (i) and (ii), the proof of inequality (1.3) is complete.
