#### Abstract

In this paper the authors have used certain fundamental concept of functional analysis to tackle a class of constrained time optimal control problems. A class of constrained time optimal control problems has been solved in 2-Banach space setting. An example is exhibited to show the technique of application of the control theory in generalized 2 -normed spaces.

Keywords and Phrases: Time optimal control, 2-Banach Space, generalized 2norm, seminorm, reflexive space, Hahn-Banach.

2000 MSC: 40A05, 46A45, 46B70.

## 1 Introduction

Minimum time optimal control problem has been solved by different authors using functional analysis technique in Banach Space setting. Minamide and Nakamura $[8,9]$ considered a related problem where the objective function was a continuous convex functional. Choudhury and Mukherjee [1,11,12] developed a uniform theory of time optimal control problem for system which can be represented in terms of linear, bounded and onto transformation from a Banach space of control function to another Banach space. Recently, the concept of 2Banach spaces has been developed. Many authors like Acikgoz [7]; Lewandowska, Moslehian and Saadatpour [24,25]; Freese and Cho [10]; Cho, Kim and Misiak [23]; Reddy and Dutta [3,5]; Park [4]; Som [14] have developed a uniform theory in 2-Banach space. Optimization in 2-Banach space setting is an important area of application of functional analysis. So, it may be worthwhile to make an attempt to develop an optimization theory in 2-Banach space. In this paper, we have developed a class of constrained time optimal control problems in 2-Banach space.
The control systems, which can be characterized by the following vector matrix differential equation:
$\frac{\mathrm{dx}}{\mathrm{dt}}=\mathrm{A}(\mathrm{t}) \mathrm{X}(\mathrm{t})+\mathrm{B}(\mathrm{t}) \mathrm{U}(\mathrm{t})$
where $\mathrm{X}(\mathrm{t})$ is an n vector, representing the instantaneous state of the system, $\mathrm{u}(\mathrm{t})$ is an $r$-vector $(r \leq n)$ representing the control input to the system, $A(t)$ is ( $n \times n$ ) matrix and $B(t)$ is an ( $n \times r$ ) matrix has received considerable attention in the literature. The solution of the above equation can be expressed in the following integral forms:

$$
\begin{equation*}
\mathrm{X}(\mathrm{t})=\varphi\left(\mathrm{t}, \mathrm{t}_{0}\right) \mathrm{X}\left(\mathrm{t}_{0}\right)+\int_{\mathrm{t}_{0}}^{\mathrm{t}} \varphi(\mathrm{t}, \mathrm{~s}) \mathrm{B}(\mathrm{~s}) \mathrm{U}(\mathrm{~s}) \mathrm{ds} \tag{2}
\end{equation*}
$$

where $\phi\left(\mathrm{t}, \mathrm{t}_{0}\right)$ is the fundamental matrix of the system (1), and $\mathrm{x}\left(\mathrm{t}_{0}\right)$, the initial state of the system at time $t=t_{0}$. The minimum time control problem, is to find the optimal control $u(t)$ belonging to the admissible set, which will drive the systems from a given initial state $x\left(t_{0}\right)$ at $t=t_{0}$, to the desired state $x_{1}$ in minimum time $t$ i.e. $x(t)=x_{1}$. Now (2) can be written as $X(t)-\varphi\left(t, t_{0}\right) X\left(t_{0}\right)=\int_{t_{0}}^{t} \varphi(t, s) B(s) U(s) d s$. Put $X(t)-\varphi\left(t, t_{0}\right) X\left(\mathrm{t}_{0}\right)=\xi$. Expression (2) can be written as $\xi=\mathrm{T}_{\mathrm{t}} \mathrm{u}$, where $T_{t} u=\int_{t}^{t} \varphi(t, s) B(s) U(s) d s$. Thus without any loss of generality one can consider the problems of finding the optimal $u$ to drive the system from the origin to any point $\xi$ in minimum time t .

The above problem can be considered as a mapping from some space to which $u$ belongs to some other space $\xi$ belongs. In the light of the above we can consider following general problem:
Let $B_{t}$ be a 2-Banach space depending on the parameter $t$ and $D$ be also a 2Banach space. Let $T_{t}$ be a bounded linear transformation depending on the parameter mapping $B_{t}$ onto $D$. The problem is to find the optimal control $u \in B_{t}$ to reach $\xi$ from the origin in minimum time $t$ under the constraint $N_{1}\left\{\left(u, u_{1}\right): u, u_{1} \in\right.$ $\left.B_{t}\right\} \leq 1$ where $N_{1}(. .$.$) denotes the 2$-norm function defined on $B_{t}$.
2. Some Preliminaries: Definition of 2-Normed space 2.1: Let $B_{t}$ be a vector space of dimension greater than one over F , where F is the real or complex number field. Suppose $N_{1}(. .$,$) be a non negative real valued function on B_{t} \times B_{t}$ which satisfies the conditions: $\quad$ (i) $N_{1}\left(u_{i}, u_{j}\right)=0$ if and only if $u_{i}$ and $u_{j}$ are linearly dependent vectors, (ii) $N_{1}\left(u_{i}, u_{j}\right)=N_{1}\left(u_{j}, u_{i}\right)$ for all $u_{i}, u_{j} \in B_{t}$, (iii) $N_{1}\left(\lambda u_{i}, u_{j}\right)=|\lambda| N_{1}\left(u_{i}, u_{j}\right)$ for all $\lambda \in F$ and for all $u_{i}, u_{j} \in B_{t}$, (iv) $N_{1}\left(u_{i}+u_{j}, z\right) \leq$ $N_{1}\left(u_{i}, z\right)+N_{1}\left(u_{j}, z\right)$ for all $u_{i}, u_{j}, z \in B_{t}$. Then $N_{1}(. .$,$) is called a 2-norm function$ defined on $\mathrm{B}_{\mathrm{t}}$ and $\left(\mathrm{B}_{\mathrm{t}}, \mathrm{N}_{1}(.,).\right)$ is called a linear 2-normed space.
A sequence $\left\{u_{n}\right\}_{n \geq 1}$ in a linear 2-normed space $B_{t}$ is called Cauchy sequence if there exist two linear independent elements $y$ and $z$ in $B_{t}$ such that $\left\{\mathrm{N}_{1}\left(\mathrm{u}_{\mathrm{n}}, \mathrm{y}\right)\right\}$ and $\left\{\mathrm{N}_{1}\left(\mathrm{u}_{\mathrm{n}}, \mathrm{z}\right)\right\}$ are real Cauchy sequence, i.e., $\lim _{\mathrm{m}, \mathrm{n}}\left\{\mathrm{N}_{1}\left(\mathrm{x}_{\mathrm{m}}-\mathrm{x}_{\mathrm{n}}, \mathrm{y}\right)\right\}=0$ and $\lim _{\mathrm{m}, \mathrm{n}}\left\{\mathrm{N}_{1}\left(\mathrm{x}_{\mathrm{m}}-\mathrm{x}_{\mathrm{n}}, \mathrm{z}\right)\right\}=0$
A sequence $\left\{u_{n}\right\}_{n \geq 1}$ in a linear 2-normed space $\left(B_{t}, N_{1}(.,).\right)$ is called convergent if there exists $\quad u \in B_{t}$ such that $\lim \left\{N_{1}\left(x_{n}-x, y\right)\right\}_{n \geq 1} \rightarrow 0 \quad \forall y \in B_{t}$, i.e., $\lim \left\{\mathrm{N}_{1}\left(\mathrm{x}_{\mathrm{n}}-\mathrm{x}, \mathrm{y}\right)\right\}_{\mathrm{n} \geq 1}=0 \quad \forall \mathrm{y} \in \mathrm{B}_{\mathrm{t}}$.
A 2-normed space $\left(\mathrm{B}_{\mathrm{t}}, \mathrm{N}_{1}(.,).\right)$ is called a 2-Banach space if every Cauchy sequence is convergent. Also if $\mathrm{B}_{\mathrm{t}}$ and D are 2-Banach spaces over the field of real numbers, it can be verified that $B_{t} \times D$ is also 2-Banach space with respect to the 2 -norm $\mathrm{N}_{3}(\ldots$,$) where \quad \mathrm{N}_{3}\left\{\left(\mathrm{u}_{\mathrm{i}}, \mathrm{v}_{\mathrm{i}}\right),\left(\mathrm{u}_{\mathrm{j}}, \mathrm{v}_{\mathrm{j}}\right)\right\}=$ $\min \left\{\mathrm{N}_{1}\left(\mathrm{u}_{\mathrm{i}}, \mathrm{u}_{\mathrm{j}}\right), \mathrm{N}_{2}\left(\mathrm{v}_{\mathrm{i}}, \mathrm{v}_{\mathrm{j}}\right)\right\}$, i.e. $\mathrm{N}_{3}(.,)=.\min \left\{\mathrm{N}_{1}(. .),. \mathrm{N}_{2}(.,).\right\} ; \mathrm{N}_{1}(.,$.$) and \mathrm{N}_{2}(.,$.$) are 2-$ norm functions defined on the spaces $B_{t}$ and $D$ respectively and $N_{3}\left\{\left(u_{i}, v_{i}\right),\left(u_{j}, v_{j}\right)\right\}=0$ iff either $u_{i}, u_{j}$ are linearly dependent (L.D.) in $B_{t}$ or $v_{i}, v_{j}$ are linearly dependent in D .
Let $N_{1}^{\prime}, N_{2}^{\prime}, N_{3}^{\prime}$ are the 2 -norm functions defined on the spaces $B_{t}^{\prime}, D^{\prime},\left(B_{t} \times D\right)^{\prime}$ respectively, where $\mathrm{N}_{3}^{\prime}(.)=,\min \left\{\mathrm{N}_{1}^{\prime}(.,),. \mathrm{N}_{2}^{\prime}(.),\right\}$ and $\mathrm{B}_{\mathrm{t}}^{\prime}$ denotes the conjugate of $B_{t}$. Let $B_{t}$ be the conjugate of $X_{t}$ and $D$ be the conjugate of $Y$. Then $B_{t}=X_{t}^{\prime}$ and $D=Y^{\prime}$. Let $\phi: D \rightarrow R \& f: X \rightarrow R$ be two functionals. Then $\phi \in D^{\prime}, f \in X^{\prime} ; f_{1} \in B_{t}^{*}$.

Example 2.1: For $X=R^{3}$, define:
$N_{1}(x, y)=\max \left\{\left|\mathrm{x}_{1} \mathrm{y}_{2}-\mathrm{x}_{2} \mathrm{y}_{1}\right|+\left|\mathrm{x}_{1} \mathrm{y}_{3}-\mathrm{x}_{3} \mathrm{y}_{1}\right|,\left|\mathrm{x}_{1} \mathrm{y}_{2}-\mathrm{x}_{2} \mathrm{y}_{1}\right|+\left|\mathrm{x}_{2} \mathrm{y}_{3}-\mathrm{x}_{3} \mathrm{y}_{2}\right|\right\}$, where $x=\left(x_{1}, x_{2}, x_{3}\right)$ and $y=\left(y_{1}, y_{2}, y_{3}\right) \in R^{3}$. Then $N_{1}(\ldots)$ is a 2-norm on $R^{3}$. See more details Freese [10], Acikgoz [7].
For examples of some known 2-normed spaces, generalized 2-normed space; see Adak [15]-[22].
Definition 2.2: Let $X$ and $Y$ be real linear spaces. Denote by $D$ a non-empty subset of $X \times Y$ such that for every $x \in X, y \in Y$ the sets $D_{x}=\{y \in Y:(x, y) \in D\}$ and $\mathrm{D}^{\mathrm{y}}=\{\mathrm{x} \in \mathrm{X}:(\mathrm{x}, \mathrm{y}) \in \mathrm{D}\}$ are linear subspaces of the spaces Y and X respectively. A function $\mathrm{N}_{5}(\ldots):, \mathrm{D} \rightarrow[0, \infty)$ will be called a generalized 2-norm on D if it satisfies the conditions: (i) $N_{5}(x, \alpha y)=|\alpha| N_{5}(x, y)=N_{5}(\alpha x, y)$ for any real number $\alpha$ and all $(x, y) \in D$; (ii) $N_{5}(x, y+z) \leq N_{5}(x, y)+N_{5}(x, z)$ for $x \in X$, $\mathrm{y}, \mathrm{z} \in \mathrm{Y}$ with $(\mathrm{x}, \mathrm{y}),(\mathrm{x}, \mathrm{z}) \in \mathrm{D}$; (iii) $\mathrm{N}_{5}(\mathrm{x}+\mathrm{y}, \mathrm{z}) \leq \mathrm{N}_{5}(\mathrm{x}, \mathrm{z})+\mathrm{N}_{5}(\mathrm{y}, \mathrm{z})$ for $\mathrm{x}, \mathrm{y} \in \mathrm{X}$, $\mathrm{z} \in \mathrm{Y}$ with $(\mathrm{x}, \mathrm{z})(\mathrm{y}, \mathrm{z}) \in \mathrm{D}$. Then D is called a 2 -normed set.
In particular, if $\mathrm{D}=\mathrm{X} \times \mathrm{Y}$, the function $\mathrm{N}_{5}(.,$.$) is said to be a generalized 2-norm$ on $\mathrm{X} \times \mathrm{Y}$ and the pair $\left(\mathrm{X} \times \mathrm{Y}, \mathrm{N}_{5}(.,).\right)$ is called a generalized 2-normed space.
Unfortunately, there is no connection between normed spaces and 2-normed spaces, but in 1999 in order to introduce some connections between normed spaces and 2-normed spaces, Lewandowska [24] introduced generalized 2-normed spaces, as a subspace of 2-normed spaces.

If $\mathrm{X}=\mathrm{Y}$, then the generalized 2-normed space $\left(\mathrm{X} \times \mathrm{X}, \mathrm{N}_{1}(.,).\right)$ is denoted by $(\mathrm{X}$, $\left.N_{1}(.,).\right)$. In the case that $X=Y, D=D^{-1}$, where $D^{-1}=\{(y, x):(x$, $y) \in D\}$, and $N_{5}(x, y)=N_{5}(y, x)$ for all $(x, y) \in D$, we call $N_{5}(.,$.$) a generalized$ symmetric 2-norm function defined on $\mathrm{X} \times \mathrm{X}$ and D a symmetric 2-norm set.

Also let $(X, N()$.$) be a normed space. Then N_{1}(x, y)=N(x)$. $N(y)$ for all $x, y \in X$ is a 2-norm function defined on $\mathrm{X} \times \mathrm{X}$. So, $\left(\mathrm{X}, \mathrm{N}_{1}(.,).\right)$ is a generalized 2-normed space.
If we take as $N(x)=N(y)$, our generalized 2-normed space will be a generalized symmetric 2-normed space with the symmetric 2-norm defined by $\mathrm{N}_{1}(\mathrm{x}, \mathrm{y})=\mathrm{N}(\mathrm{x})$. $N(y)$ for all $x, y \in X$.

Let us remark that a symmetric 2-normed space need not be a 2 -normed space in the sense of Gahler [13]. For instance given above, $x \neq \theta, y=k x, k \neq 0$, we obtain $N_{1}(x, y)=N_{1}(x, k x)=|k| N_{1}(x, x)>0$, but inspite of this $x$ and $y$ are linearly dependent. So from this, we say that the 2normed space is not a 2 -normed space in the sense of Definition 2.1. Each 2-normed space is a generalized 2-normed space. But, in case of $\mathrm{X}=\mathrm{Y}, \mathrm{D}=$ $\mathrm{D}^{-1}$; the generalized 2-normed space is a 2-normed space.
Throughout the paper, $\mathrm{N}_{1}, \mathrm{~N}_{2}, \mathrm{~N}_{3}, \mathrm{~N}_{1}^{\prime}, \mathrm{N}_{2}^{\prime}, \mathrm{N}_{3}^{\prime}$ denote the 2-norm functions defined on the spaces $B_{t}, D,\left(B_{t} \times D\right), B_{t}^{\prime}, D^{\prime},\left(B_{t} \times D\right)^{\prime}$ respectively which are defined earlier in Definition 2.1.

## Problem Statement

In this paper we shall consider the problem where the constraints on the control function are given as: $\left|\mathrm{u}_{\ell}\right| \cdot\left|\mathrm{u}_{\mathrm{m}}\right| \leq \mathrm{N}$,
$\left\{\iint_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{r}}(\tau)\right|^{2} \mathrm{~d} \tau\right\}^{\frac{1}{2}} \cdot\left\{\left.\int_{0}^{\mathrm{t}} \int_{\mathrm{s}}(\tau)\right|^{2} \mathrm{~d} \tau\right\}^{\frac{1}{2}} \leq \mathrm{M}, \mathrm{M}$ and N being positive constraints. The
problem is to find the optimal control function $u$ which will drive the origin (initial state) to $\boldsymbol{\xi}$ (desired state) in minimum time t , satisfying the above constraints.
For the sake of completeness, we shall now give certain Definitions, Theorems and Lemmas.

$\beta \in \mathrm{Y}, \beta \neq \theta$ be the unit balls in $\mathrm{B}_{\mathrm{t}}$, D respectively.
Deffinition: The set of all points $\xi \in D$, such that $T_{t} u=\xi$ for some $u \in U_{t} \subset B_{t}$ will be called the Reachable set and will be denoted by $C(t)$, where $U_{t}$ is the unit ball in $B_{t}$, for some given time $t$.
Deffinition: Let X be a 2-Normed linear space. A non-negative real valued function $\rho(.,$.$) on X \times X$ is called a seminorm if it satisfies the conditions:(i) $\rho\left(\mathrm{x}_{\mathrm{i}}+\mathrm{x}_{\mathrm{j}}, \mathrm{z}\right) \leq \rho\left(\mathrm{x}_{\mathrm{i}}, \mathrm{z}\right)+\rho\left(\mathrm{x}_{\mathrm{j}}, \mathrm{z}\right) \quad \forall \quad \mathrm{x}_{\mathrm{i}}, \quad \mathrm{x}_{\mathrm{j}}, \quad \mathrm{z} \in \mathrm{X}$, (ii) $\rho\left(\lambda x_{i}, x_{j}\right)=|\lambda| \rho\left(x_{i}, x_{j}\right)$ for all $\lambda \in F$ and for all $x_{i}, x_{j}, \in X$.

Deffinition: Let X be a 2-Normed linear space. A 2-norm $\rho_{1}(\ldots)$ on $\mathrm{X} \times \mathrm{X}$ is said to be equivalent to a 2 -norm $\rho_{2}(\ldots$,$) on X \times X$ if there are positive numbers a and $b$ such that

$$
a \rho_{2}\left(x_{i}, x_{j}\right) \leq \rho_{1}\left(x_{i}, x_{j}\right) \leq b \rho_{2}\left(x_{i}, x_{j}\right) . \text { In }
$$

following theorems $B_{t}, T_{t}, D$ will mean the same as define earlier, until they are specially defined.
Theorem 1: If $B_{t}$ and $D$ be the conjugate spaces of the 2-Normed linear spaces $X_{t}$ and $Y$ respectively and $T_{t}$ is the adjoint of some bounded linear transformation $S$, mapping Y one to one and on to a closed subspace of $\mathrm{X}_{\mathrm{t}}$, then $\mathrm{C}(\mathrm{t})$ is closed.
Proof: By [18] (Corollary 2.1) the unit ball in $X_{t}^{*}$ is weak ${ }^{*}$ compact. Also, both $X_{t}^{*}$ and $D$ are equipped with their weak ${ }^{*}$ topologies. Again, as $T_{t}$ is adjoint to $S$, $\mathrm{T}_{\mathrm{t}}$ will also be onto and remains continuous with respect to weak ${ }^{*}$ topologies of
$X_{t}^{*}$ and D. Consequently, the unit ball of $X_{t}^{*}$ will be mapped onto a weak* compact subset of D . Hence $\mathrm{C}(\mathrm{t})$ is weak ${ }^{*}$ closed and therefore weakly closed and hence norm closed in D.
Note: Let X be a 2-normed linear space and $\mathrm{X}^{*}$ be its conjugate. Hahn-Banach theorem $[16,17]$ assures that that $\mathrm{N}_{1}\left\{\left(\mathrm{x}_{\mathrm{i}}, \mathrm{x}_{\mathrm{j}}\right): \mathrm{x}_{\mathrm{i}}, \mathrm{x}_{\mathrm{j}} \in \mathrm{X}\right\} \neq 0$. Then there exists a real bounded 2-linear functional $F \in X^{*}$, defined on the whole space, such that $\mathrm{F}\left(\mathrm{x}_{\mathrm{i}}, \mathrm{x}_{\mathrm{j}}\right)=\mathrm{N}_{1}\left\{\left(\mathrm{x}_{\mathrm{i}}, \mathrm{x}_{\mathrm{j}}\right): \mathrm{x}_{\mathrm{i}}, \mathrm{x}_{\mathrm{j}} \in \mathrm{X}\right\}$ and
$\sup _{x, y \operatorname{are~not~L.D.~}} \frac{\left|F\left(x_{i}, x_{j}\right)\right|}{N_{1}\left\{\left(x_{i}, x_{j}\right): x_{i}, x_{j} \in X\right\} \neq 0}=1 . \quad$ Such an $F$ will be called an extremal of $x$.
Note $[16,18]$ : The Reachable set is also convex body, symmetric with respect to the origin of $D$.
Theorem 2: Let $B_{t}$ be the conjugate space of the 2-normed linear space $X_{t}$ and $D$ is the conjugate of some 2 -normed linear space Y . Let $\xi \in \delta \mathrm{C}(\mathrm{t})$, where $\delta \mathrm{C}(\mathrm{t})$ denotes the boundary of $\mathrm{C}(\mathrm{t})$ for some given time t . Then there exists at least one $\mathrm{u}_{\xi}(\mathrm{t}) \in \mathrm{U}_{\mathrm{t}} \subset \mathrm{B}_{\mathrm{t}}$ which will transfer the system from origin to $\xi \in \delta \mathrm{C}(\mathrm{t})$ in minimum time $t$, where $T_{t}$ is an in Theorem 1.
Proof: As Y is reflexive [17], $\mathrm{D}=\mathrm{Y}^{*}$ is evidently a reflexive space. Now, $\mathrm{S}: \mathrm{Y} \rightarrow \mathrm{X}_{\mathrm{t}^{*}}$ implies $\mathrm{S}^{*}: \mathrm{X}_{\mathrm{t}^{*}}^{*} \rightarrow \mathrm{Y}^{*}$ that is, $\mathrm{S}^{*}: \mathrm{B}_{\mathrm{t}^{*}} \rightarrow \mathrm{D}$. since Y is reflexive $\mathrm{S}^{* *}: \mathrm{Y} \rightarrow \mathrm{B}_{\mathrm{t}^{*}}^{*}$. Therefore $\mathrm{S}^{* *}=\mathrm{S}^{*}$. But $\mathrm{S}^{*}=\overline{\mathrm{T}}_{\mathrm{t}}^{*}$ (by hypothesis). Hence $\mathrm{S}^{* *}=\mathrm{T}_{\mathrm{t}}^{*}$. Consequently $\mathrm{S}^{* *}=\mathrm{S}=\mathrm{T}_{\mathrm{t}^{*}}^{*}$. Again $\mathrm{S}: \mathrm{Y} \rightarrow \mathrm{X}_{\mathrm{t}^{*}}$ i.e. $\mathrm{S}: \mathrm{D}^{*} \rightarrow \mathrm{X}_{\mathrm{t}}^{*}$. If $\phi \in D^{*}$ then $S \phi \in X_{t^{*}}$ and so $\bar{S} \varphi \in X_{t^{*}}^{*}$ where $\bar{S} \varphi$ denotes the extremal of $S \phi$ i.e. $\mathrm{T}_{\mathrm{t}^{*}}^{*} \varphi \in \mathrm{X}_{\mathrm{t}^{*}}^{*}=\mathrm{B}_{\mathrm{t}^{*}}$ with $\mathrm{N}_{1}\left\{\left(\mathrm{~T}_{\mathrm{t}}^{*} \varphi, \mathrm{f}\right): \mathrm{T}_{\mathrm{t}}^{*} \varphi, \mathrm{f} \in \mathrm{B}_{\mathrm{t}}^{* *}\right\}=1$. Now if $\mathrm{t}^{*}$ is the minimum time to reach $\xi$, then $\xi \in \partial \mathrm{C}\left(\mathrm{t}^{*}\right)$. Let $\phi \xi \in \mathrm{D}^{*}$ be the supporting hyper plane to $\partial \mathrm{C}\left(\mathrm{t}^{*}\right)$ at $\xi$ let $\mathrm{u}_{\phi}$ be optimal control to reach $\xi$ in minimum time $\mathrm{t}^{*}$, then $u_{\varphi}=T_{t}^{*} * \varphi, N_{1}\left\{\left(u_{\varphi}, u_{1}\right): u_{\varphi}, u_{1} \in U_{t}\right\}=1$. Thus $u_{\varphi} \in B_{t} *$. See $[16,18]$ for determining $\phi \xi$ and $t^{*}$ for a given $\xi$. Let $N_{1}^{\prime}, N_{2}^{\prime}, N_{3}^{\prime}$ are the 2-norms of the spaces $\mathrm{X}_{\mathrm{t}}^{*}, \mathrm{Y}^{*},\left(\mathrm{X}_{\mathrm{t}} \times \mathrm{Y}\right)^{*}$ respectively, where $\mathrm{X}^{*}$ denotes the conjugate space of X .

Theorem 3: On a finite dimensional 2-normed linear space $X$, any 2-norm $\rho_{1}(.,$. is equivalent to any other 2-norm $\rho_{2}(\ldots,$.$) .$
Remark 1: If $D$ is finite dimensional, then $S$ always exist. We state the following lemmas which can be easily proved.
Lemma 1: Let $X$ be a 2-normed linear space. If $\rho_{1}(x)$ and $\rho_{2}(x)$ are the seminorm and 2-norms respectively in $X$, then, $\operatorname{Max}\left\{\rho_{1}(x), \rho_{2}(x)\right\}$ is a 2-norm in $X$, where $x$ $\in \mathrm{X}$.
Corollary: Evidently $\operatorname{Max}\left\{\rho_{1}(x), \rho_{2}(x)\right\}$ is a 2-norm, where each of $\left\{\rho_{1}(x), \rho_{2}(x)\right\}$ is a 2 -norm.

## Lemma 2:

$$
\rho_{2}\left(\mathrm{u}_{\ell}, \mathrm{u}_{\mathrm{m}}\right)=\operatorname{Max}\left\{\operatorname{esss}_{0 \leq \tau \leq \mathrm{t}} \frac{\left|\mathrm{u}_{\ell}(\tau)\right|}{\mathrm{N}}, \frac{1}{\mathrm{M}}\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\ell}(\tau)\right| \mathrm{d} \tau\right)^{1 / 2}\right\} \cdot \operatorname{Max}\left\{\operatorname{essssp}_{0 \leq \tau \leq \mathrm{t}} \frac{\left|\mathrm{u}_{\mathrm{m}}(\tau)\right|}{\mathrm{N}}, \frac{1}{\mathrm{M}}\left(\int_{0}^{t}\left|\mathrm{u}_{\mathrm{m}}(\tau)\right| \mathrm{d} \tau\right)^{1 / 2}\right\}
$$

is equivalent to $\rho_{1}\left(u_{i}, u_{j}\right)=\underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup }\left|\mathrm{u}_{\mathrm{i}}(\tau)\right| \cdot \underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup }\left|\mathrm{u}_{\mathrm{j}}(\tau)\right|$ which is a 2-norm on $L_{\infty}(0, t)$.
Proof: We have
$\frac{1}{\mathrm{M}}\left(\int_{0}^{\mathrm{t}}|\mathrm{u}(\tau)|^{2} \mathrm{~d} \tau\right)^{1 / 2} \leq \frac{1}{\mathrm{M}} \operatorname{ess} \operatorname{s\leq \tau \leq \mathrm {t}} \mathrm{p}|\mathrm{u}(\tau)| \cdot \sqrt{\mathrm{t}}=\frac{\mathrm{N}}{\mathrm{M}} \underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup }|\mathrm{u}(\tau)| \cdot \sqrt{\mathrm{t}}$
We shall consider two cases, case (i) and case (ii), and two subcases of case (ii).
Case (i): If $\mathrm{t} \leq \frac{\mathrm{M}^{2}}{\mathrm{~N}^{2}}$,

$$
\begin{align*}
& \left.\frac{1}{M}\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{r}}(\tau)\right|^{2} \mathrm{~d} \tau\right)^{1 / 2} \cdot \frac{1}{\mathrm{M}}\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{s}}(\tau)\right|^{2} \mathrm{~d} \tau \quad\right)^{1 / 2} \leq \underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup } \frac{\mid \mathrm{u}_{\ell}(\tau}{\mathrm{N}} \right\rvert\, \underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup } \frac{\left|\mathrm{u}_{\mathrm{m}}(\tau)\right|}{\mathrm{N}} \\
& \therefore \rho_{2}\left(\mathrm{u}_{\ell}, \mathrm{u}_{\mathrm{m}}\right)=\underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup } \frac{\left|\mathrm{u}_{\ell}(\tau)\right|}{\mathrm{N}} \underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup } \frac{\left|\mathrm{u}_{\mathrm{m}}(\tau)\right|}{\mathrm{N}}=\rho_{1}\left(\mathrm{u}_{\mathrm{i}}, \mathrm{u}_{\mathrm{j}}\right) \text { for } \mathrm{t} \leq \frac{\mathrm{M}^{2}}{\mathrm{~N}^{2}} \tag{3}
\end{align*}
$$

Hence $\rho_{2}\left(\mathrm{u}_{\ell}, \mathrm{u}_{\mathrm{m}}\right)$ is equivalent to $\rho_{1}\left(\mathrm{u}_{\mathrm{i}}, \mathrm{u}_{\mathrm{j}}\right) \quad$ for $\mathrm{t} \leq \frac{\mathrm{M}^{2}}{\mathrm{~N}^{2}}$.
Case (ii): $\quad \mathrm{t}>\frac{\mathrm{M}^{2}}{\mathrm{~N}^{2}}$. There will be two subcases:
(a)
$\underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup } \frac{\left|\mathrm{u}_{\ell}(\tau)\right|}{\mathrm{N}} \underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup } \frac{\left|\mathrm{u}_{\mathrm{m}}(\tau)\right|}{\mathrm{N}}=\frac{1}{\mathrm{M}}\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{r}}(\tau)\right|^{2} \mathrm{~d} \tau \quad\right)^{1 / 2} \cdot \frac{1}{\mathrm{M}}\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{S}}(\tau)\right|^{2} \mathrm{~d} \tau\right)^{1 / 2}$ on a set of finite measure.
(b)
$\underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup } \frac{\left|\mathrm{u}_{\ell}(\tau)\right|}{\mathrm{N}} \underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup } \frac{\left|\mathrm{u}_{\mathrm{m}}(\tau)\right|}{\mathrm{N}}<\frac{1}{\mathrm{M}}\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{r}}(\tau)\right|^{2} \mathrm{~d} \tau \quad\right)^{1 / 2} \cdot \frac{1}{\mathrm{M}}\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{S}}(\tau)\right|^{2} \mathrm{~d} \tau\right)^{1 / 2}$
almost everywhere.
We make use of the following notations:
$\rho_{3}\left(u_{p}, u_{q}\right)=\underset{0 \leq \tau \leq t}{\operatorname{esss} \sup } \frac{\left|u_{p}(\tau)\right|}{N} \underset{0 \leq \tau \leq t}{\operatorname{esssup}} \frac{\left|u_{q}(\tau)\right|}{N}, \rho_{4}\left(u_{r}, u_{s}\right)=\frac{1}{M}\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{r}}(\tau)\right|^{2} d \tau\right)^{1 / 2} \cdot \frac{1}{\mathrm{M}}\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{s}}(\tau)\right|^{2} \mathrm{~d} \tau\right)^{1 / 2}$.
Obviously $\rho_{3}\left(u_{p}, u_{q}\right)$ and $\rho_{4}\left(u_{r}, u_{s}\right)$ are 2-norms and they are equivalent to
$\rho_{1}\left(u_{i}, u_{j}\right)$ and $\rho_{2}\left(u_{\ell}, u_{m}\right)$ respectively.
In case (ii) (a): $\rho_{2}\left(u_{\ell}, u_{m}\right)=\rho_{3}\left(u_{p}, u_{q}\right)=\rho_{4}\left(u_{r}, u_{s}\right)$,
$\therefore \rho_{2}\left(u_{\ell}, u_{m}\right) \leq \rho_{3}\left(u_{p}, u_{q}\right) \leq \rho_{2}\left(u_{\ell}, u_{m}\right)$
In case (ii) (b): $\rho_{2}\left(\mathrm{u}_{\ell}, \mathrm{u}_{\mathrm{m}}\right)=\rho_{4}\left(\mathrm{u}_{\mathrm{r}}, \mathrm{u}_{\mathrm{s}}\right) \leq \underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup } \frac{\left|\mathrm{u}_{\mathrm{p}}(\tau)\right|}{\mathrm{N}} \underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup } \frac{\left|\mathrm{u}_{\mathrm{q}}(\tau)\right|}{\mathrm{N}} \cdot \sqrt{\mathrm{t}}$
or
$\frac{M}{N \sqrt{t}} \rho_{2}\left(u_{\ell}, u_{m}\right) \leq \underset{0 \leq \tau \leq t}{\operatorname{ess} \sup } \frac{\left|u_{p}(\tau)\right|}{N} \underset{0 \leq \tau \leq t}{\operatorname{essssp}} \frac{\left|u_{q}(\tau)\right|}{N}=\rho_{3}\left(u_{p}, u_{q}\right)<\rho_{4}\left(u_{r}, u_{s}\right)=\rho_{1}\left(u_{i}, u_{j}\right)$
Combining (3), (4) and (5) we obtain
$\operatorname{Max}\left\{1, \frac{\mathrm{M}}{\mathrm{N} \sqrt{\mathrm{t}}}\right\} \rho_{2}\left(\mathrm{u}_{\ell}, \mathrm{u}_{\mathrm{m}}\right) \leq \rho_{3}\left(\mathrm{u}_{\mathrm{p}}, \mathrm{u}_{\mathrm{q}}\right) \leq \rho_{2}\left(\mathrm{u}_{\ell}, \mathrm{u}_{\mathrm{m}}\right)$
But $\rho_{3}\left(\mathrm{u}_{\mathrm{p}}, \mathrm{u}_{\mathrm{q}}\right)$ is obviously equivalent to $\rho_{1}\left(\mathrm{u}_{\mathrm{i}}, \mathrm{u}_{\mathrm{j}}\right)$. Hence from (6) $\rho_{2}\left(\mathrm{u}_{\ell}, \mathrm{u}_{\mathrm{m}}\right)$ is equivalent to $\rho_{1}\left(u_{i}, u_{j}\right)$. Hence the proof.

Definition: We define $L_{\infty, N, M}$ to be the space of all essentially bounded functions u , equipped with the 2 -norm $\rho_{2}\left(\mathrm{u}_{\ell}, \mathrm{u}_{\mathrm{m}}\right)$.

Definition: We define $\mathrm{L}_{\infty, \mathrm{N}}$ to be the space of all essentially bounded functions u , equipped with the 2-norm $\rho_{3}\left(u_{p}, u_{q}\right)=\underset{0 \leq \tau \leq t}{\operatorname{esss} \sup } \frac{\left|u_{p}(\tau)\right|}{N} \underset{0 \leq \tau \leq t}{\operatorname{esssup}} \frac{\left|u_{q}(\tau)\right|}{N}$.

Definition: The space $L_{M}$ consist of all square integrable functions $u$, equipped with the 2-norm $\rho_{4}\left(u_{r}, u_{s}\right)=\frac{1}{\mathrm{M}}\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{r}}(\tau)\right|^{2} \mathrm{~d} \tau \quad\right)^{1 / 2} \cdot \frac{1}{\mathrm{M}}\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{s}}(\tau)\right|^{2} \mathrm{~d} \tau\right)^{1 / 2}$.

Note: Evidently $\rho_{3}\left(u_{p}, u_{q}\right)$ and $\rho_{4}\left(u_{r}, u_{s}\right)$ are equivalent to $\rho_{1}\left(u_{i}, u_{j}\right)$ and $\rho_{2}\left(\mathrm{u}_{\ell}, \mathrm{u}_{\mathrm{m}}\right)$ respectively and hence the space $\mathrm{L}_{\infty, \mathrm{N}}$ and $\mathrm{L}_{\infty, \mathrm{M}}$ are complete with respect to their respective 2 -norms $\rho_{3}\left(\mathrm{u}_{\mathrm{p}}, \mathrm{u}_{\mathrm{q}}\right)$ and $\rho_{4}\left(\mathrm{u}_{\mathrm{r}}, \mathrm{u}_{\mathrm{s}}\right)$.

Consider a system described by (1) where $u(t)$ is a scalar control. Assume that at $t$ $=0$ the state of the system is given be $x(0)$. It is required to find $u(t)$ which will bring the system from the initial state $x(0)$ to the origin of the state space in the least time under the constraint
$\left|\mathrm{u}_{\ell}(\tau) \cdot\right| \mathrm{u}_{\mathrm{m}}(\tau) \mid \leq \mathrm{N},\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{r}}(\tau)\right|^{2} \mathrm{~d} \tau\right)^{\frac{1}{2}} \cdot\left(\left.\left.\int_{0}^{\mathrm{t}}\right|_{\mathrm{u}_{\mathrm{s}}(\tau)}\right|^{2} \mathrm{~d} \tau\right)^{\frac{1}{2}} \leq \mathrm{M}$.
The above constraints can be expressed in the following alternative form:
$\mathrm{J}\left(\mathrm{u}_{\ell}, \mathrm{v}_{\mathrm{m}}\right)=\operatorname{Max}\left\{\operatorname{essssup}_{0 \leq \tau \leq \mathrm{t}} \frac{\left|\mathrm{u}_{\ell}(\tau)\right|}{\mathrm{N}}, \frac{1}{\mathrm{M}}\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\ell}(\tau)\right| \mathrm{d} \tau \quad\right)^{1 / 2}\right\} \cdot \operatorname{Max}\left\{\operatorname{esssup}_{0 \leq \tau \leq \mathrm{t}}^{\operatorname{ess}} \frac{\left|\mathrm{u}_{\mathrm{m}}(\tau)\right|}{\mathrm{N}}, \frac{1}{\mathrm{M}}\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{m}}(\tau)\right| \mathrm{d} \tau\right)^{1 / 2}\right\}$
From Lemma 1, it follows that $\mathrm{J}\left(\mathrm{u}_{\ell}, \mathrm{v}_{\mathrm{m}}\right)$ is a 2-norm in $\mathrm{L}_{\infty, \mathrm{N}, \mathrm{M}}$.
Now $L_{\infty, N, M}$ can be considered as the conjugate of the space $L_{1, N, M}$ i.e. $\mathrm{L}_{1, \mathrm{~N}, \mathrm{M}}^{*}=\mathrm{L}_{\infty, \mathrm{N}, \mathrm{M}}$ where $*$ denotes the conjugate of the corresponding spaces. Here $T_{t}: L_{\infty, N, M} \rightarrow R^{n}$ where $R^{n}$ denotes the $n$-dimensional Euclidean space. In the finite dimensional case it can be easily shown that $T_{t}^{*}=S$ is one to one and onto a closed subspace of $\mathrm{L}_{1, \mathrm{~N}, \mathrm{M}}$, where $\mathrm{S}: \mathrm{R}^{\mathrm{n}} \rightarrow \mathrm{L}_{1, \mathrm{~N}, \mathrm{M}}$. By Theorem 1 one can easily verify that the corresponding Reachable set is closed. Also By Theorem 2, it follows that there exists an optimal control $u_{\varphi}$.

## The Form Of The Optimal Control

The problem is to find u which will maximize $\left\langle\mathrm{u}, \mathrm{T}_{\mathrm{t}}^{*} \varphi\right\rangle$, under the constraint
$\left|\mathrm{u}_{\ell}(\tau)\right| \cdot\left|\mathrm{u}_{\mathrm{m}}(\tau)\right| \leq \mathrm{N}, \frac{1}{\mathrm{M}}\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{r}}(\tau)\right| \mathrm{d} \tau\right)^{\frac{1}{2}} \cdot \frac{1}{\mathrm{M}}\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{s}}(\tau)\right|^{2} \mathrm{~d} \tau\right)^{\frac{1}{2}} \leq 1$

Case (I): If $\mathrm{t} \leq \frac{\mathrm{M}^{2}}{\mathrm{~N}^{2}}$, then
$\rho_{2}\left(\mathrm{u}_{\ell}, \mathrm{u}_{\mathrm{m}}\right)=\underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup } \frac{\left|\mathrm{u}_{\ell}(\tau)\right|}{\mathrm{N}} \underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{esssup}} \frac{\left|\mathrm{u}_{\mathrm{m}}(\tau)\right|}{\mathrm{N}}=1$.
$\therefore \underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup }\left|\mathrm{u}_{\ell}(\tau)\right| \cdot \underset{0 \leq \tau \leq \mathrm{t}}{\text { ess sup }}\left|\mathrm{u}_{\mathrm{m}}(\tau)\right|=\mathrm{N}$
Now, the optimal $u$ must satisfy the condition $\left\langle u, T_{t}^{*} \varphi\right\rangle=N_{1}^{\prime}\left\{\left(T_{t}^{*} \varphi, f_{1}\right): T_{t}^{*} \varphi, f_{1} \in B_{t}^{*}\right\}$ and $\rho_{3}\left(u_{p}, u_{q}\right)=1$. So the problem is to find $a u$, which will maximize
$\left\langle\mathrm{u}, \mathrm{T}_{\mathrm{t}}^{*} \varphi\right\rangle=\int_{0}^{\mathrm{t}} \mathrm{u}(\tau)\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi\right)(\tau) \mathrm{d} \tau$ subject to $\underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup }|\mathrm{u}(\tau)|=\mathrm{N}$. Evidently the optimal $\mathrm{u}(\mathrm{t})$ will be given by $\mathrm{u}_{\varphi}(\tau)=\mathrm{N} \operatorname{sign}\left[\mathrm{T}_{\mathrm{t}}^{*} \varphi(\tau)\right], 0 \leq \tau \leq \mathrm{t}$ and $\left\langle\mathrm{u}, \mathrm{T}_{\mathrm{t}}^{*} \varphi\right\rangle=\mathrm{N} \int_{0}^{\mathrm{t}}\left|\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi\right)(\tau)\right| \mathrm{d} \tau$ It can easily verified that $N_{1}^{\prime}\left\{\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi, \mathrm{f}_{1}\right): \mathrm{T}_{\mathrm{t}}^{*} \varphi, \mathrm{f}_{1} \in \mathrm{~B}_{\mathrm{t}}^{*}\right\}=\mathrm{N} \int_{0}^{\mathrm{t}}\left|\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi\right)(\tau)\right| \mathrm{d} \tau$.

## Case (II) (a)

$$
\rho_{2}\left(\mathrm{u}_{\ell}, \mathrm{u}_{\mathrm{m}}\right)=\underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup } \frac{\left|\mathrm{u}_{\ell}(\tau)\right|}{\mathrm{N}} \underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup } \frac{\left|\mathrm{u}_{\mathrm{m}}(\tau)\right|}{\mathrm{N}}=\frac{1}{\mathrm{M}}\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{r}}(\tau)\right|^{2} \mathrm{~d} \tau \quad\right)^{1 / 2} \cdot \frac{1}{\mathrm{M}}\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{s}}(\tau)\right|^{2} \mathrm{~d} \tau\right)^{1 / 2} \leq 1 .
$$

Hence $\quad \underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup }\left|\mathrm{u}_{\ell}(\tau)\right| \underset{0 \leq \tau \leq \mathrm{t}}{\operatorname{ess} \sup }\left|\mathrm{u}_{\mathrm{m}}(\tau)\right|=\mathrm{N}$ and $\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{r}}(\tau)\right|^{2} \mathrm{~d} \tau . \int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{S}}(\tau)\right|^{2} \mathrm{~d} \tau=\mathrm{M}^{2}$.
Consequently, one has to find that $u(\tau)$ which will maximize
$\left\langle\mathrm{u}, \mathrm{T}_{\mathrm{t}}^{*} \varphi\right\rangle=\int_{0}^{t} u(\tau)\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi\right)(\tau) \mathrm{d} \tau$.
Let $\mathrm{E}=\left\{\mathrm{t}:\left|\mathrm{u}_{\ell}(\tau)\right| \cdot\left|\mathrm{u}_{m}(\tau)\right|=\mathrm{N}\right\}$ and $\mathrm{E}_{\mathrm{c}}=\left\{\mathrm{t}:\left|\mathrm{u}_{\ell}(\tau)\right| \cdot\left|\mathrm{u}_{m}(\tau)\right|<\mathrm{N}\right\}$
$\therefore \int_{0}^{\mathrm{t}} \mathrm{u}(\tau)\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi\right)(\tau) \mathrm{d} \tau=\int_{\mathrm{E}} \mathrm{u}(\tau)\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi\right)(\tau) \mathrm{d} \tau+\int_{\mathrm{E}_{\mathrm{C}}} \mathrm{u}(\tau)\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi\right)(\tau) \mathrm{d} \tau$.
Now $\int_{E} u(\tau)\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi\right)(\tau) \mathrm{d} \tau$ will be maximized if $\mathrm{u}(\tau)=\mathrm{N} \operatorname{sign}\left[\mathrm{T}_{\mathrm{t}}^{*} \varphi(\tau)\right], \tau \in \mathrm{E}$.
Again $\int_{0}^{\mathrm{t}}|\mathrm{u}(\tau)|^{2} \mathrm{~d} \tau=\mathrm{M}^{2}$ i.e $\int_{E}|\mathrm{u}(\tau)|^{2} \mathrm{~d} \tau+\int_{E_{C}}|\mathrm{u}(\tau)|^{2} \mathrm{~d} \tau=M^{2}$
or, $\int_{E_{C}}|u(\tau)|^{2} d \tau=M^{2}-N^{2} m(E)$, where $m(E)$ denotes the measure of the set $E$.
So, $\int_{\mathrm{E}_{\mathrm{C}}} \mathrm{u}(\tau)\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi\right)(\tau) \mathrm{d} \tau$ will be maximized under the constraint (A), if we take $u(\tau)=\alpha\left(T_{t}^{*} \varphi\right)(\tau)$ where $\alpha$ is a positive constant. Substituting $u=\alpha\left(T_{t}^{*} \varphi\right)(\tau)$ in
(A), we have $\alpha^{2} \int_{E_{C}}\left|\left(\mathrm{~T}_{\mathrm{t}}^{*} \varphi\right)(\tau)\right|^{2} d \tau=\mathrm{M}^{2}-\mathrm{N}^{2} \mathrm{~m}(\mathrm{E})$, where $\alpha=\frac{\sqrt{\mathrm{M}^{2}-\mathrm{N}^{2} \mathrm{~m}(\mathrm{E})}}{\sqrt{\left.\left|\int_{\mathrm{E}_{\mathrm{C}}}\right| \mathrm{T}_{\mathrm{t}}^{*}(\varphi)(\tau)\right|^{2} \mathrm{~d} \tau}}$
$\operatorname{Max}\left\langle\mathrm{u}, \mathrm{T}_{\mathrm{t}}^{*} \varphi\right\rangle=\mathrm{N} \int_{E}\left|\left(\mathrm{~T}_{\mathrm{t}}^{*} \varphi\right)(\tau)\right| \mathrm{d} \tau+\sqrt{\mathrm{M}^{2}-\mathrm{N}^{2} \mathrm{~m}(\mathrm{E})} \cdot \sqrt{\int_{\mathrm{E}_{\mathrm{C}}}\left|\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi\right)(\tau)\right|^{2} \mathrm{~d} \tau}$. It can easily verified that

$$
\mathrm{N}_{1}^{\prime}\left\{\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi, \mathrm{f}_{1}\right): \mathrm{T}_{\mathrm{t}}^{*} \varphi, \mathrm{f}_{1} \in \mathrm{~B}_{\mathrm{t}}^{*}\right\}=\mathrm{N} \int_{E}\left(\mathrm{~T}_{\mathrm{t}}^{*} \varphi\right)(\tau) \mid \mathrm{d} \tau+\sqrt{\mathrm{M}^{2}-\mathrm{N}^{2} \mathrm{~m}(\mathrm{E})} \cdot \sqrt{\int_{\mathrm{E}_{\mathrm{C}}}\left|\left(\mathrm{~T}_{\mathrm{t}}^{*} \varphi\right)(\tau)\right|^{2} \mathrm{~d} \tau},
$$

from the above it follows that

$$
\mathrm{u}(\tau)=\left\{\begin{array}{l}
\mathrm{N} \operatorname{sign}\left[\alpha\left(\mathrm{~T}_{\mathrm{t}}^{*} \varphi\right)(\tau)\right], \tau \in \mathrm{E}=\left\{\mathrm{t}:\left|\alpha\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi\right)(\tau)\right|>\mathrm{N}\right\} \\
\left.\alpha\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi\right)(\tau)\right], \tau \in \mathrm{E}_{\mathrm{C}}=\left\{\mathrm{t}:\left|\alpha\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi\right)(\tau)\right| \leq \mathrm{N}\right\}
\end{array} .\right.
$$

Case (II) (b): $\rho_{2}\left(\mathrm{u}_{\ell}, \mathrm{u}_{\mathrm{m}}\right)=\frac{1}{\mathrm{M}}\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{r}}(\tau)\right|^{2} \mathrm{~d} \tau \quad\right)^{1 / 2} \cdot \frac{1}{\mathrm{M}}\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{s}}(\tau)\right|^{2} \mathrm{~d} \tau\right)^{1 / 2}=1$
Or,
$\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{r}}(\tau)\right|^{2} \mathrm{~d} \tau\right)^{1 / 2} \cdot\left(\int_{0}^{\mathrm{t}}\left|\mathrm{u}_{\mathrm{S}}(\tau)\right|^{2} \mathrm{~d} \tau\right)^{1 / 2}=\mathrm{M}^{2}$
Now, the problem becomes, find $u$ which will
maximize $\int_{0}^{t} u(\tau)\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi\right)(\tau) \mathrm{d} \tau \quad$ under the constraint $\quad$ (B).
Obviously $\mathrm{u}_{\varphi}=\alpha\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi\right)$, such that $\alpha^{2} \int_{0}^{t}\left|\left(\mathrm{~T}_{\mathrm{t}}^{*} \varphi\right)(\tau)\right|^{2} \mathrm{~d} \tau=\mathrm{M}^{2}$ i.e. $\alpha=\frac{\mathrm{M}}{\sqrt{\left.\int_{0}^{t}\left(\mathrm{~T}_{\mathrm{t}}^{*} \varphi\right)(\tau)\right|^{2} d \tau}}$.
$\mathrm{u}_{\varphi}(\tau)=\alpha\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi\right)(\tau)=\frac{\mathrm{M}\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi\right)(\tau)}{\sqrt{\left.\int_{0}^{t}\left(\mathrm{~T}_{\mathrm{t}}^{*} \varphi\right)(\tau)\right|^{2} d \tau}}$ and $\int_{0}^{t} u(\tau)\left(\mathrm{T}_{\mathrm{t}}^{*} \varphi\right)(\tau) \mathrm{d} \tau=\alpha \int_{0}^{t}\left|\left(\mathrm{~T}_{\mathrm{t}}^{*} \varphi\right)(\tau)\right|^{2} \mathrm{~d} \tau$

Example: Let us consider the n-th order constant linear system $\frac{\mathrm{dx}(\mathrm{t})}{\mathrm{dt}}=\mathrm{AX}(\mathrm{t})+\mathrm{B} \mathrm{U}(\mathrm{t})$, where $\mathrm{X}(\mathrm{t}), \mathrm{U}(\mathrm{t}), \mathrm{A}, \mathrm{B}$ have their usual meanings. The problem which we shall consider here is to find the admissible control vector $U(t)$ such that the trajectories described by the system under $U(t)$ remain within an $\varepsilon$ neighbourhood of the target state $x^{d}$. $\mathrm{N}_{1}\left\{\left(\mathrm{x}\left(\mathrm{t}_{1}\right)-\mathrm{x}^{\mathrm{d}}, \mathrm{u}\right): \mathrm{x}\left(\mathrm{t}_{1}\right)-\mathrm{x}^{\mathrm{d}}, \mathrm{u} \in \mathrm{X}\right\} \leq \varepsilon$ where
$X=\underset{t_{0} \leq \leq \leq t_{1}}{\text { ess } \operatorname{mup}_{1 \leq i} \leq r} \max _{i}\left|x_{i}(t)\right| \cdot \operatorname{coss}_{t_{0} \leq t \leq t_{1}} \max _{1 \leq j \leq r}\left|X_{j}(t)\right|$, while $t_{0} \leq t \leq t_{1}$ minimizing the fuel functional
$\tau=\left[\mathrm{t}_{0}, \mathrm{t}_{1}\right], \mathrm{t}_{0} \& \mathrm{t}_{1}$ being initial and final times respectively. Let us now specify the 2-Banach spaces and linear operators as follows:

$$
\mathrm{X}=\mathrm{B}_{\infty, \infty}^{(\mathrm{r})} \times \mathrm{B}_{\infty, \infty}^{(\mathrm{r})}=\mathrm{L}_{\infty}\left(\ell_{\infty}(\mathrm{r}), \tau\right) \times \mathrm{L}_{\infty}\left(\ell_{\infty}(\mathrm{r}), \tau\right), \mathrm{Y}=\ell_{\infty}(\eta) \times \ell_{\infty}(\eta), \mathrm{Z}=\mathrm{B}_{1,1}^{(\mathrm{r})} \times \mathrm{B}_{1,1}^{(\mathrm{r})}=\mathrm{L}_{1}\left(\ell_{1}(\mathrm{r}), \tau\right) \times \mathrm{L}_{1}\left(\ell_{1}(\mathrm{r}), \tau\right),
$$

Then by definition (2.2), X Y, Z are generalized 2-normed spaces.

$$
S: X \rightarrow Y, S u=\int_{t_{0}}^{t_{1} A\left(t_{1}-s\right)} B U(s) d s, T: X \rightarrow Z, T u=-u \text {, Taking } \xi=X^{d}-e^{-A\left(t_{1}-t_{0}\right)} X\left(t_{0}\right) \text { and } \eta=T U_{0}=-U_{0} .
$$

The auxiliary problem becomes finding U , such that
$\mathrm{N}_{2}\{(\xi-\mathrm{Tu}(.,), \mathrm{w}):. \xi-\mathrm{Tu}(.,),. \mathrm{w} \in \mathrm{Y}\} \leq \varepsilon, \mathrm{J}\left(\mathrm{u}_{\mathrm{i}}, \mathrm{u}_{\mathrm{j}}\right)$ is minimized. For further details, see [15].

Some examples are given in Adak ([15], [18], [19]) to show the technique of application of the control theory in generalized 2-normed spaces.

Note 1: Any complete 2-normed space is said to be 2-Banach space. Every 2normed space of dimension 2 is a 2-Banach space when the underlying field is complete. For details see Adak [18, 21] \& White [2]. A linear 2-normed space of dimension 3 is not a 2-Banach space. For details see White [2].
Note 2: Every 2-normed space is a locally convex topological vector space. But convers is not true. In fact for a fixed $b \in X, P_{b}(x)=N_{1}(x, b) \forall x \in X$, is a seminorm and the family $\mathrm{P}=\left\{\mathrm{P}_{\mathrm{b}}\right.$ : $\left.\mathrm{b} \in \mathrm{X}\right\}$ generates a locally convex topology on X . Such a topology is called the natural topology induced by 2-norm $\mathrm{N}_{1}(.,$.$) .$

Conclusion: In the previous papers [18, 20, 21], we introduced generalized 2normed spaces and 2-normed spaces. There are appropriate connections between: (i) normed spaces and generalized 2 -normed spaces, (ii) 2-normed spaces and generalized 2 -normed spaces, (iii) 2-normed spaces and 2-Banach spaces, (iv) 2normed spaces and locally convex topological vector spaces, (v) generalized 2normed spaces and generalized symmetric 2-normed spaces.
In this paper we introduced semi-norm and equivalent norm. There are appropriate connections among semi-norm, 2-norm and equivalent norm.

Acknowledgement: The authors are most grateful to Prof. R. N. Mukherjee of the Department of Mathematics, University of Burdwan, Burdwan, West Bengal, India, for his generous encouragement and suggestions at various steps while preparing this paper.
