

## ON DIFFERENTIAL SUBORDINATIONS FOR A CLASS OF ANALYTIC FUNCTIONS DEFINED BY A LINEAR OPERATOR

V. RAVICHANDRAN, HERB SILVERMAN, S. SIVAPRASAD KUMAR,  
and K. G. SUBRAMANIAN

Received 25 September 2003

We obtain several results concerning the differential subordination between analytic functions and a linear operator defined for a certain family of analytic functions which are introduced here by means of these linear operators. Also, some special cases are considered.

2000 Mathematics Subject Classification: 30C45, 30C80.

**1. Introduction.** Let  $\mathcal{A}_0$  be the class of normalized analytic functions  $f(z)$  with  $f(0) = 0$  and  $f'(0) = 1$  which are defined in the unit disk  $\Delta := \{z \in \mathbb{C} : |z| < 1\}$ . Let  $\mathcal{A}$  be the class of all analytic functions  $p(z)$  with  $p(0) = 1$  which are defined on  $\Delta$ . The class  $\mathcal{P}$  of *Carathéodory* functions consists of functions  $p(z) \in \mathcal{A}$  having positive real part. For two functions  $f(z)$  and  $g(z)$  given by

$$f(z) = z + \sum_{n=2}^{\infty} a_n z^n, \quad g(z) = z + \sum_{n=2}^{\infty} b_n z^n, \quad (1.1)$$

their Hadamard product (or convolution) is defined, as usual, by

$$(f * g)(z) := z + \sum_{n=2}^{\infty} a_n b_n z^n =: (g * f)(z). \quad (1.2)$$

Define the function  $\phi(a, c; z)$  by

$$\phi(a, c; z) := \sum_{n=0}^{\infty} \frac{(a)_n}{(c)_n} z^{n+1} \quad (c \neq 0, -1, -2, \dots; z \in \Delta), \quad (1.3)$$

where  $(x)_n$  is the Pochhammer symbol or the shifted factorial defined by

$$(x)_n = \begin{cases} 1, & n = 0, \\ x(x+1)(x+2) \cdots (x+n-1), & n \in \mathbb{N} := \{1, 2, 3, \dots\}. \end{cases} \quad (1.4)$$

Corresponding to the function  $\phi(a, c; z)$ , Carlson and Shaffer [1] introduced a linear operator  $L(a, c)$  on  $\mathcal{A}_0$  by the following convolution:

$$L(a, c)f(z) := \phi(a, c; z) * f(z), \quad (1.5)$$

or, equivalently, by

$$L(a, c)f(z) := z + \sum_{n=1}^{\infty} \frac{(a)_n}{(c)_n} a_{n+1} z^{n+1} \quad (z \in \Delta). \tag{1.6}$$

It follows from (1.6) that

$$z(L(a, c)f(z))' = aL(a + 1, c)f(z) - (a - 1)L(a, c)f(z). \tag{1.7}$$

For two functions  $f$  and  $g$  analytic in  $\Delta$ , we say that the function  $f(z)$  is *subordinate* to  $g(z)$  in  $\Delta$ , and write

$$f \prec g \quad \text{or} \quad f(z) \prec g(z) \quad (z \in \Delta), \tag{1.8}$$

if there exists a Schwarz function  $w(z)$ , analytic in  $\Delta$  with

$$w(0) = 0, \quad |w(z)| < 1 \quad (z \in \Delta), \tag{1.9}$$

such that

$$f(z) = g(w(z)) \quad (z \in \Delta). \tag{1.10}$$

In particular, if the function  $g$  is *univalent* in  $\Delta$ , the above subordination is equivalent to

$$f(0) = g(0), \quad f(\Delta) \subset g(\Delta). \tag{1.11}$$

Over the past few decades, several authors have obtained criteria for univalence and starlikeness depending on bounds of the functionals  $zf'(z)/f(z)$  and  $1 + zf''(z)/f'(z)$ . See [4, 5, 7] and the references in [7]. In [2, 6], certain results involving linear operators were considered. In this paper, we obtain sufficient conditions involving

$$\frac{L(a + 1, c)f(z)}{L(a, c)f(z)}, \quad \frac{L(a + 2, c)f(z)}{L(a + 1, c)f(z)} \tag{1.12}$$

for functions to satisfy the subordination

$$\frac{L(a, c)f(z)}{L(a + 1, c)f(z)} \prec q(z), \quad \left( \frac{L(a + 1, c)f(z)}{L(a, c)f(z)} \right)^\beta \prec q(z) \quad (q(z) \in \mathcal{A}). \tag{1.13}$$

Also, we obtain sufficient conditions involving

$$\frac{L(a + 2, c)f(z)}{L(a + 1, c)f(z)}, \quad \frac{L(a + 1, c)f(z)}{z} \tag{1.14}$$

for functions to satisfy the subordination

$$\left( \frac{L(a, c)f(z)}{z} \right)^\beta \prec q(z), \quad \frac{z}{L(a + 1, c)f(z)} \prec q(z) \quad (q(z) \in \mathcal{A}). \tag{1.15}$$

Since  $L(n + 1, 1)f(z) = D^n f(z)$ , where  $D^n f(z)$  is the Ruscheweyh derivative of  $f(z)$ , our results can be specialized to the Ruscheweyh derivative and we omit these details. Note that the Ruscheweyh derivative of order  $\delta$  is defined by

$$D^\delta f(z) := \frac{z}{(1-z)^{\delta+1}} * f(z) \quad (f \in \mathcal{A}_0; \delta > -1) \tag{1.16}$$

or, equivalently, by

$$D^\delta f(z) := z + \sum_{k=2}^{\infty} \binom{\delta+k-1}{k+1} a_k z^k \quad (f \in \mathcal{A}_0; \delta > -1). \tag{1.17}$$

In our present investigation, we need the following result of Miller and Mocanu [3] to prove our main results.

**THEOREM 1.1** (cf. [3, Theorem 3.4h, page 132]). *Let  $q(z)$  be univalent in the unit disk  $\Delta$  and let  $\vartheta$  and  $\varphi$  be analytic in a domain  $\mathbb{D} \supset q(\Delta)$  with  $\varphi(w) \neq 0$ , when  $w \in q(\Delta)$ . Set*

$$Q(z) := zq'(z)\varphi(q(z)), \quad h(z) := \vartheta(q(z)) + Q(z). \tag{1.18}$$

Suppose that

- (1)  $Q$  is starlike univalent in  $\Delta$ ;
- (2)  $\Re(zh'(z)/Q(z)) > 0$  for  $z \in \Delta$ .

If  $p(z)$  is analytic in  $\Delta$ , with  $p(0) = q(0)$ ,  $p(\Delta) \subset \mathbb{D}$ , and

$$\vartheta(p(z)) + zp'(z)\varphi(p(z)) < \vartheta(q(z)) + zq'(z)\varphi(q(z)), \tag{1.19}$$

then  $p(z) < q(z)$  and  $q(z)$  is the best dominant.

**2. Main results.** We begin with the following.

**THEOREM 2.1.** *Let  $\alpha, \beta$ , and  $\gamma$  be real numbers,  $\beta \neq 0$ , and  $(1+a)\beta\gamma < 0$ . Let  $q(z) \in \mathcal{A}$  be univalent in  $\Delta$  and let it satisfy the following condition for  $z \in \Delta$ :*

$$\Re\left(1 + \frac{zq''(z)}{q'(z)}\right) > \begin{cases} \frac{\beta + (1+a)\gamma}{\beta} & \text{if } \frac{\beta + \gamma(a+1)}{\beta} \geq 0, \\ 0 & \text{if } \frac{\beta + \gamma(a+1)}{\beta} \leq 0. \end{cases} \tag{2.1}$$

If  $f(z) \in \mathcal{A}_0$  and

$$\begin{aligned} & \frac{L(a,c)f(z)}{L(a+1,c)f(z)} \left\{ \alpha \frac{L(a+1,c)f(z)}{L(a,c)f(z)} + \beta \frac{L(a+2,c)f(z)}{L(a+1,c)f(z)} + \gamma \right\} \\ & < \frac{1}{a+1} \{ \alpha(a+1) + a\beta + [\beta + \gamma(a+1)]q(z) - \beta zq'(z) \}, \end{aligned} \tag{2.2}$$

then

$$\frac{L(a,c)f(z)}{L(a+1,c)f(z)} < q(z) \tag{2.3}$$

and  $q(z)$  is the best dominant.

**PROOF.** Define the function  $p(z)$  by

$$p(z) := \frac{L(a,c)f(z)}{L(a+1,c)f(z)}. \tag{2.4}$$

Then, clearly,  $p(z)$  is analytic in  $\Delta$ . Also, by a simple computation, we find from (2.4) that

$$\frac{zp'(z)}{p(z)} = \frac{z(L(a,c)f(z))'}{L(a,c)f(z)} - \frac{z(L(a+1,c)f(z))'}{L(a+1,c)f(z)}. \tag{2.5}$$

By making use of the familiar identity (1.7) in (2.5), we get

$$\frac{L(a+2,c)f(z)}{L(a+1,c)f(z)} = \frac{1}{a+1} \left( 1 + \frac{a}{p(z)} - \frac{zp'(z)}{p(z)} \right). \tag{2.6}$$

By using (2.4) and (2.6), we obtain

$$\begin{aligned} & \left[ \alpha \frac{L(a+1,c)f(z)}{L(a,c)f(z)} + \beta \frac{L(a+2,c)f(z)}{L(a+1,c)f(z)} + \gamma \right] \frac{L(a,c)f(z)}{L(a+1,c)f(z)} \\ &= \left[ \frac{\alpha}{p(z)} + \frac{\beta}{a+1} \left( 1 + \frac{a}{p(z)} - \frac{zp'(z)}{p(z)} \right) + \gamma \right] p(z) \\ &= \frac{1}{a+1} \{ (a+1)\alpha + a\beta + [\beta + \gamma(a+1)]p(z) - \beta zp'(z) \}. \end{aligned} \tag{2.7}$$

In view of (2.7), the subordination (2.2) becomes

$$[\beta + \gamma(a+1)]p(z) - \beta zp'(z) < [\beta + \gamma(a+1)]q(z) - \beta zq'(z) \tag{2.8}$$

and this can be written as (1.19), where

$$\vartheta(w) := [\beta + \gamma(a+1)]w, \quad \varphi(w) := -\beta. \tag{2.9}$$

Note that  $\vartheta(w), \varphi(w)$  are analytic in  $\mathbb{C}$ . Since  $\beta \neq 0$ , we have  $\varphi(w) \neq 0$ . Let the functions  $Q(z)$  and  $h(z)$  be defined by

$$\begin{aligned} Q(z) &:= zq'(z)\varphi(q(z)) = -\beta zq'(z), \\ h(z) &:= \vartheta(q(z)) + Q(z) = [\beta + (a+1)\gamma]q(z) - \beta zq'(z). \end{aligned} \tag{2.10}$$

In light of hypothesis (2.1) stated in Theorem 2.1, we see that  $Q(z)$  is starlike and

$$\Re \left\{ \frac{zh'(z)}{Q(z)} \right\} = \Re \left\{ \frac{\gamma(a+1) + \beta}{-\beta} + \left( 1 + \frac{zq''(z)}{q'(z)} \right) \right\} > 0. \tag{2.11}$$

The result of Theorem 2.1 now follows by an application of Theorem 1.1. □

Note that

$$\begin{aligned} L(1,1)f(z) &= f(z), \\ L(2,1)f(z) &= zf'(z), \\ L(3,1)f(z) &= zf'(z) + \frac{z^2 f''(z)}{2}. \end{aligned} \tag{2.12}$$

By taking  $a = c = 1$  in [Theorem 2.1](#) and after a change in the parameters, we have the following.

**COROLLARY 2.2.** *Let  $\alpha$  be a real number,  $1 + \alpha > 0$ , and let  $q(z)$  be univalent in  $\Delta$ , and let it satisfy*

$$\Re\left(1 + \frac{zq''(z)}{q'(z)}\right) > \begin{cases} -\alpha & \text{if } \alpha \leq 0, \\ 0 & \text{if } \alpha \geq 0. \end{cases} \tag{2.13}$$

If  $f \in A_0$  and

$$\frac{f(z)}{zf'(z)} \left\{ (1 - \alpha) \frac{zf'(z)}{f(z)} - \left(1 + \frac{zf''(z)}{f'(z)}\right) + \alpha \right\} < zq'(z) + \alpha q(z) - \alpha, \tag{2.14}$$

then

$$\frac{f(z)}{zf'(z)} < q(z) \tag{2.15}$$

and  $q(z)$  is the best dominant.

If we take

$$q(z) = 1 + \frac{\lambda}{1 + \alpha} z \tag{2.16}$$

in [Corollary 2.2](#), we obtain a recent result of Singh [[7](#), Theorem 1(i), page 571].

By using [Theorem 1.1](#), we can show the following.

**LEMMA 2.3.** *Let  $\gamma, \beta$  be real numbers,  $\beta \neq 0$ , and  $1 > \gamma/\beta$ . Let  $q(z) \in \mathcal{A}$  be univalent in  $\Delta$  and let it satisfy*

$$\Re\left(1 + \frac{zq''(z)}{q'(z)}\right) > \begin{cases} \frac{\gamma}{\beta} & \text{if } \frac{\gamma}{\beta} \geq 0, \\ 0 & \text{if } \frac{\gamma}{\beta} \leq 0. \end{cases} \tag{2.17}$$

If  $p(z) \in \mathcal{A}$  satisfies

$$\gamma p(z) - \beta zp'(z) < \gamma q(z) - \beta zq'(z), \tag{2.18}$$

then  $p(z) < q(z)$  and  $q(z)$  is the best dominant.

By using [Lemma 2.3](#), or from [Theorem 2.1](#), we have the following.

**COROLLARY 2.4.** *Let  $\alpha, \beta, \gamma$  be real numbers,  $\beta \neq 0$ , and  $1 > \gamma/\beta$ . Let  $q(z) \in \mathcal{A}$  be univalent in  $\Delta$  and let it satisfy (2.17). If  $f(z) \in \mathcal{A}_0$  satisfies*

$$\frac{f(z)}{zf'(z)} \left\{ \alpha \frac{zf'(z)}{f(z)} + \beta \left( 1 + \frac{zf''(z)}{f'(z)} \right) + \gamma \right\} < \alpha + \beta - \beta zq'(z) + \gamma q(z), \tag{2.19}$$

then (2.15) holds and  $q(z)$  is the best dominant.

By using Theorem 1.1, we obtain the following.

**THEOREM 2.5.** *Let  $a \neq -1$ . Let  $\alpha, \beta, \gamma$ , and  $\delta$  be real numbers,  $\alpha \neq 0$ , and  $1 + \delta(a+1)(\alpha+\gamma)/\alpha > 0$ . Let  $q(z) \in \mathcal{A}$  be univalent in  $\Delta$  and let it satisfy the following condition for  $z \in \Delta$ :*

$$\Re \left( 1 + \frac{zq''(z)}{q'(z)} \right) > \begin{cases} -\frac{\delta(a+1)(\alpha+\gamma)}{\alpha} & \text{if } \frac{\delta(a+1)(\alpha+\gamma)}{\alpha} \leq 0, \\ 0 & \text{if } \frac{\delta(a+1)(\alpha+\gamma)}{\alpha} \geq 0. \end{cases} \tag{2.20}$$

If  $f(z) \in \mathcal{A}_0$  and

$$\left\{ \alpha \frac{L(a+2,c)f(z)}{L(a+1,c)f(z)} + \beta \left( \frac{z}{L(a+1,c)f(z)} \right)^\delta + \gamma \right\} \left( \frac{L(a+1,c)f(z)}{z} \right)^\delta < \frac{\alpha}{\delta(a+1)} zq'(z) + (\alpha+\gamma)q(z) + \beta, \tag{2.21}$$

then

$$\left( \frac{L(a+1,c)f(z)}{z} \right)^\delta < q(z) \tag{2.22}$$

and  $q(z)$  is the best dominant.

**PROOF.** Define the function  $p(z)$  by

$$p(z) := \left( \frac{L(a+1,c)f(z)}{z} \right)^\delta. \tag{2.23}$$

Then, clearly,  $p(z)$  is analytic in  $\Delta$ . Also, by a simple computation, we find from (2.23) that

$$\frac{zp'(z)}{p(z)} = \frac{\delta z(L(a+1,c)f(z))'}{L(a+1,c)f(z)} - \delta. \tag{2.24}$$

By making use of the familiar identity (1.7) in (2.24), we get

$$\frac{L(a+2,c)f(z)}{L(a+1,c)f(z)} = \frac{1}{\delta(a+1)} \frac{zp'(z)}{p(z)} + 1. \tag{2.25}$$

By using (2.23) and (2.25), we obtain

$$\begin{aligned} & \left\{ \alpha \frac{L(a+2, c)f(z)}{L(a+1, c)f(z)} + \beta \left( \frac{z}{L(a+1, c)f(z)} \right)^\delta + \gamma \right\} \left( \frac{L(a+1, c)f(z)}{z} \right)^\delta \\ &= \left\{ \alpha \left( \frac{1}{\delta(a+1)} \frac{zp'(z)}{p(z)} + 1 \right) + \frac{\beta}{p(z)} + \gamma \right\} p(z) \\ &= \frac{\alpha}{\delta(a+1)} zp'(z) + (\alpha + \gamma)p(z) + \beta. \end{aligned} \quad (2.26)$$

In view of (2.26), the subordination (2.21) becomes

$$\delta(a+1)(\alpha + \gamma)p(z) + \alpha zp'(z) < \delta(a+1)(\alpha + \gamma)q(z) + \alpha zq'(z) \quad (2.27)$$

and this can be written as (1.19), where

$$\vartheta(w) := \delta(a+1)(\alpha + \gamma)w, \quad \varphi(w) := \alpha. \quad (2.28)$$

Note that  $\varphi(w) \neq 0$  and  $\vartheta(w)$ ,  $\varphi(w)$  are analytic in  $\mathbb{C}$ . Let the functions  $Q(z)$  and  $h(z)$  be defined by

$$\begin{aligned} Q(z) &:= zq'(z)\varphi(q(z)) = \alpha zq'(z), \\ h(z) &:= \vartheta(q(z)) + Q(z) = \delta(a+1)(\alpha + \gamma)q(z) + \alpha zq'(z). \end{aligned} \quad (2.29)$$

By hypothesis (2.20) stated in Theorem 2.5, we see that  $Q(z)$  is starlike and

$$\Re \left\{ \frac{zh'(z)}{Q(z)} \right\} = \Re \left\{ \frac{\delta(a+1)(\alpha + \gamma)}{\alpha} + \left( 1 + \frac{zq''(z)}{q'(z)} \right) \right\} > 0. \quad (2.30)$$

Thus, by an application of Theorem 1.1, the proof of Theorem 2.5 is completed.  $\square$

By taking  $a = c = 1$  in Theorem 2.5 and after a suitable change in the parameters, we have the following.

**COROLLARY 2.6.** *Let  $\alpha, \beta \neq 0$  be real and  $1 + \alpha > 0$ . Let  $q(z)$  be univalent in  $\Delta$  and let it satisfy (2.13). If  $f \in A_0$  and*

$$\left\{ \beta \frac{zf''(z)}{f'(z)} + \alpha \left( 1 - [f'(z)]^{-\beta} \right) \right\} [f'(z)]^\beta < zq'(z) + \alpha q(z) - \alpha, \quad (2.31)$$

then

$$[f'(z)]^\beta < q(z) \quad (2.32)$$

and  $q(z)$  is the best dominant.

If we take (2.16) in Corollary 2.6, we obtain a recent result of Singh [7, Theorem 1(ii), page 571].

**THEOREM 2.7.** *Let  $a \neq -1$ . Let  $\alpha, \beta$ , and  $\gamma$  be real numbers and let  $\beta, \gamma \neq 0$  and  $1 + \alpha/\gamma > 0$ . Let  $q(z) \in \mathcal{A}$  be univalent in  $\Delta$  and let it satisfy the following condition for  $z \in \Delta$ :*

$$\Re\left(1 + \frac{zq''(z)}{q'(z)}\right) > \begin{cases} -\frac{\alpha}{\gamma} & \text{if } \frac{\alpha}{\gamma} \leq 0, \\ 0 & \text{if } \frac{\alpha}{\gamma} \geq 0. \end{cases} \tag{2.33}$$

If  $f(z) \in \mathcal{A}_0$  and

$$\left(\frac{L(a+1,c)f(z)}{L(a,c)f(z)}\right)^\beta \left\{ \beta\gamma \left[ (a+1) \frac{L(a+2,c)f(z)}{L(a+1,c)f(z)} - a \frac{L(a+1,c)f(z)}{L(a,c)f(z)} - 1 \right] + \alpha \right\} < \gamma zq'(z) + \alpha q(z), \tag{2.34}$$

then

$$\left(\frac{L(a+1,c)f(z)}{L(a,c)f(z)}\right)^\beta < q(z) \tag{2.35}$$

and  $q(z)$  is the best dominant.

**PROOF.** Define the function  $p(z)$  by

$$p(z) := \left(\frac{L(a+1,c)f(z)}{L(a,c)f(z)}\right)^\beta. \tag{2.36}$$

Then, clearly,  $p(z)$  is analytic in  $\Delta$ . Also, by a simple computation together with the use of the familiar identity (1.7), we find from (2.36) that

$$\frac{1}{\beta} \frac{zp'(z)}{p(z)} = (a+1) \frac{L(a+2,c)f(z)}{L(a+1,c)f(z)} - a \frac{L(a+1,c)f(z)}{L(a,c)f(z)} - 1. \tag{2.37}$$

Therefore, it follows from (2.36) and (2.37) that

$$\begin{aligned} &\left(\frac{L(a+1,c)f(z)}{L(a,c)f(z)}\right)^\beta \left\{ \beta\gamma \left[ (a+1) \frac{L(a+2,c)f(z)}{L(a+1,c)f(z)} - a \frac{L(a+1,c)f(z)}{L(a,c)f(z)} - 1 \right] + \alpha \right\} \\ &= \gamma zp'(z) + \alpha p(z). \end{aligned} \tag{2.38}$$

In view of (2.38), the subordination (2.34) becomes

$$\gamma zp'(z) + \alpha p(z) < \gamma zq'(z) + \alpha q(z) \tag{2.39}$$

and this can be written as (1.19), where

$$\vartheta(w) := \alpha w, \quad \varphi(w) := \gamma. \tag{2.40}$$

Note that  $\varphi(w) \neq 0$  and  $\vartheta(w)$ ,  $\varphi(w)$  are analytic in  $\mathbb{C}$ . Let the functions  $Q(z)$  and  $h(z)$  be defined by

$$\begin{aligned} Q(z) &:= zq'(z)\varphi(q(z)) = \gamma zq'(z), \\ h(z) &:= \vartheta(q(z)) + Q(z) = \alpha q(z) + \gamma zq'(z). \end{aligned} \tag{2.41}$$

In light of hypothesis (2.33) stated in Theorem 2.7, we see that  $Q(z)$  is starlike and

$$\Re \left\{ \frac{zh'(z)}{Q(z)} \right\} = \Re \left\{ \frac{\alpha}{\gamma} + \left( 1 + \frac{zq''(z)}{q'(z)} \right) \right\} > 0. \tag{2.42}$$

Since  $\vartheta$  and  $\varphi$  satisfy the conditions of Theorem 1.1, the result follows by an application of Theorem 1.1. □

By taking  $a = c = 1$  in Theorem 2.7 and after a suitable change in the parameters, we have the following.

**COROLLARY 2.8.** *Let  $\alpha, \beta \neq 0$  and  $\gamma$  be real with  $1 + \alpha/\gamma > 0$ . Let  $q(z)$  be univalent in  $\Delta$  and let it satisfy (2.33).*

*If  $f \in A_0$  and*

$$\left( \frac{zf'(z)}{f(z)} \right)^\beta \left\{ \beta\gamma \left[ 1 + \frac{zf''(z)}{f'(z)} - \frac{zf'(z)}{f(z)} \right] + \alpha \right\} \prec \gamma zq'(z) + \alpha q(z), \tag{2.43}$$

*then*

$$\left( \frac{zf'(z)}{f(z)} \right)^\beta \prec q(z) \tag{2.44}$$

*and  $q(z)$  is the best dominant.*

If we take (2.16) and  $\gamma = 1$  in Corollary 2.8, we obtain a recent result of Singh [7, Theorem 1(iii), page 571] and, by setting

$$q(z) = \int_0^1 \frac{1 - \lambda z t^\alpha}{1 + \lambda z t^\alpha} dt \tag{2.45}$$

and  $\alpha = 1$  in Corollary 2.8, we obtain another recent result of Singh [7, Theorem 3, page 573].

**THEOREM 2.9.** *Let  $\alpha \neq 0$  and  $\gamma$  be real numbers,  $(a + 1)\alpha\gamma < 0$ . Let  $q(z) \in \mathcal{A}$  be univalent in  $\Delta$  and let it satisfy the following condition for  $z \in \Delta$ :*

$$\Re \left( 1 + \frac{zq''(z)}{q'(z)} \right) > \begin{cases} \frac{\alpha + \gamma(a + 1)}{\alpha} & \text{if } \frac{\alpha + \gamma(a + 1)}{\alpha} \geq 0, \\ 0 & \text{if } \frac{\alpha + \gamma(a + 1)}{\alpha} \leq 0. \end{cases} \tag{2.46}$$

If  $f(z) \in \mathcal{A}_0$  and

$$\begin{aligned} & \alpha \frac{L(a,c)f(z)}{L(a+1,c)f(z)} \left( \frac{L(a+2,c)f(z)}{L(a+1,c)f(z)} \right) + \gamma \frac{L(a,c)f(z)}{L(a+1,c)f(z)} \\ & < \frac{a\alpha}{a+1} + \left( \frac{\alpha}{a+1} + \gamma \right) q(z) - \frac{\alpha}{a+1} zq'(z), \end{aligned} \tag{2.47}$$

then

$$\frac{L(a,c)f(z)}{L(a+1,c)f(z)} < q(z) \tag{2.48}$$

and  $q(z)$  is the best dominant.

The proof of this theorem is similar to that of [Theorem 2.1](#) and hence it is omitted.

By taking  $a = c = 1$  in [Theorem 2.9](#) and after a suitable change in the parameters, we have the following.

**COROLLARY 2.10.** *Let  $0 \leq \alpha \leq 1$  and  $q(z)$  be univalent in  $\Delta$  and let them satisfy*

$$\Re \left( 1 + \frac{zq''(z)}{q'(z)} \right) > \begin{cases} \alpha & \text{if } \alpha \geq 0 \\ 0 & \text{if } \alpha \leq 0. \end{cases} \tag{2.49}$$

If  $f \in \mathcal{A}_0$  and

$$\frac{f(z)}{zf'(z)} \left( 1 + \frac{zf''(z)}{f'(z)} \right) - \alpha \left( \frac{f(z)}{zf'(z)} - 1 \right) < (1 + \alpha) - \alpha q(z) - zq'(z), \tag{2.50}$$

then [\(2.15\)](#) holds and  $q(z)$  is the best dominant.

Let

$$q(z) = 1 + \frac{\lambda z}{k} \int_0^1 \frac{t^\alpha}{1 + (z/k)t} dt. \tag{2.51}$$

After a change of variable in [\(2.51\)](#), we get

$$q(z) = 1 + \frac{\lambda}{z^\alpha} \int_0^z \frac{\eta^\alpha}{k + \eta} d\eta. \tag{2.52}$$

By differentiating [\(2.52\)](#), we have

$$zq'(z) = \frac{\lambda z}{k+z} - \alpha q(z) + \alpha \tag{2.53}$$

or

$$\alpha - \alpha q(z) - zq'(z) = -\frac{\lambda z}{k+z}. \tag{2.54}$$

Since the bilinear transform

$$w = -\frac{\lambda z}{k+z} \tag{2.55}$$

maps  $\Delta$  onto the disk

$$\left| w + \frac{\lambda}{1-k^2} \right| \leq \frac{|\lambda|k}{k^2-1}, \quad (2.56)$$

from [Corollary 2.10](#) for the function  $q(z)$  given by (2.51), we obtain a recent result of Singh [7, Theorem 2(i), page 572].

**THEOREM 2.11.** *Let  $\alpha \neq 0$  and  $\gamma$  be real numbers,  $(a+1)\alpha\gamma < 0$ . Let  $q(z) \in \mathcal{A}$  be univalent in  $\Delta$  and let it satisfy (2.46) for  $z \in \Delta$ .*

*If  $f(z) \in \mathcal{A}_0$  and*

$$\alpha z \frac{L(a+2, c)f(z)}{[L(a+1, c)f(z)]^2} + \gamma \frac{z}{L(a+1, c)f(z)} < (\alpha + \gamma)q(z) - \frac{\alpha}{a+1} zq'(z), \quad (2.57)$$

*then*

$$\frac{z}{L(a+1, c)f(z)} < q(z) \quad (2.58)$$

*and  $q(z)$  is the best dominant.*

The proof of this theorem is similar to that of [Theorem 2.1](#) and therefore it is omitted.

By taking  $a = c = 1$  in [Theorem 2.11](#) and after a suitable change in the parameters, we have the following.

**COROLLARY 2.12.** *Let  $0 \leq \alpha \leq 1$  and  $q(z)$  be univalent in  $\Delta$  and let them satisfy (2.49). If  $f \in \mathcal{A}_0$ ,  $f'(z)f'(z)/z \neq 0$ , and*

$$\frac{zf''(z)}{f'(z)^2} - \alpha \left( \frac{1}{f'(z)} - 1 \right) < \alpha - \alpha q(z) - zq'(z), \quad (2.59)$$

*then*

$$\frac{1}{f'(z)} < q(z) \quad (2.60)$$

*and  $q(z)$  is the best dominant.*

On setting (2.51) in [Corollary 2.12](#), we obtain a recent result of Singh [7, Theorem 2(ii), page 572].
