This paper investigates finite-time synchronization of the singular hybrid coupled networks. The singular systems studied in this paper are assumed to be regular and impulse-free. Some sufficient conditions are derived to ensure finite-time synchronization of the singular hybrid coupled networks under a state feedback controller by using finite-time stability theory. A numerical example is finally exploited to show the effectiveness of the obtained results.

1. Introduction

In recent years, singular systems, also known as descriptor systems, generalized state-space systems, differential-algebraic systems, or semistate systems, are attracting more and more attentions from many fields of scientific research because they can better describe a larger class of dynamic systems than the regular ones. Many results of regular systems have been extended to the area about singular systems such as [1–21]. For example, stability (robust stability or quadratic stability) and stabilization for singular systems have been studied via LMI approach in [2–8]; robust control (or H_2, H_∞ control and robust dissipative filtering) for singular systems has been discussed in [9–16]; synchronization (or state estimation) for singular complex networks has been considered in [17–21].

Synchronization is an interesting and important characteristic in the coupled networks. There are a lot of results in regular coupled networks. Recently, some authors study synchronization of the singular systems such as [17–21] and the references therein. In [17], Xiong et al. introduced the singular hybrid coupled systems to describe complex network with a special class of constrains. They gave a sufficient condition for global synchronization of singular hybrid coupled system with time-varying nonlinear perturbation

based on Lyapunov stability theory. Synchronization issues are studied for singular systems with delays by using Linear Matrix Inequality (LMI) approach [18]. Koo et al. considered synchronization of singular complex dynamical network with time-varying delays [19]. Li et al. in [20] investigated synchronization and state estimation for singular complex dynamical networks with time-varying delays. Li et al. in [21] investigated robust H_∞ control of synchronization for uncertain singular complex delayed networks with stochastic switched coupling.

Finite-time synchronization or finite-time control is interesting topic for its practical application. There are some results on finite-time stability [22–26], finite-time synchronization [27–33], finite-time consensus or agreement [34–37], and finite-time observers [38]. However, these results are obtained for regular systems. Up to now, to the best of our knowledge, few authors studied finite-time synchronization of singular hybrid coupled systems whose structures are more complex than those in [27–33]. Considering the important role of synchronization of complex networks, the finite-time synchronization of singular hybrid coupled networks is worth studying.

Motivated by the previous discussions, in this paper, we investigate finite-time synchronization of singular hybrid complex systems. Some sufficient conditions for it are

obtained by the state feedback controller based on the finite-time stability theory. Finally, a numerical example is exploited to illustrate the effectiveness of the obtained result.

The rest of this paper is organized as follows. In Section 2, a singular hybrid coupled system is given, and some preliminaries are briefly outlined. In Section 3, some sufficient criteria are derived for the finite-time synchronization of the proposed singular system by the feedback controller. In Section 4, an example is provided to show the effectiveness of the obtained results. Some conclusions are finally drawn in Section 5.

2. Model Formulation and Some Preliminaries

Consider a singular hybrid coupled system as follows:

$$E\dot{x}_i(t) = Ax_i(t) + f(x_i(t), t) + c\sum_{j=1}^{N} b_{ij}(t)\Gamma x_j(t),$$

$$i = 1, 2, \ldots, N, \tag{1}$$

where $x_i(t) = (x_{i1}(t), x_{i2}(t), \ldots, x_{in}(t))^T \in \mathbb{R}^n$ represents the state vector of the ith node, $A, E \in \mathbb{R}^{n \times n}$ are constant matrices, and E may be singular. Without loss of generality, we will assume that $0 < \text{rank}(E) = r < n$. $f(x_i(t), t)$ is a vector-value function. The constant $c > 0$ denotes the coupling strength, and $\Gamma = \text{diag}(\gamma_1, \gamma_2, \ldots, \gamma_n) \in \mathbb{R}^{n \times n}$ is inner-coupling matrix between nodes. $B = (b_{ij})_{N \times N}$ describes the linear coupling configuration of the network, which satisfies

$$b_{ij} = b_{ji}, \quad \text{for } i \neq j,$$

$$b_{ii} = -\sum_{j=1, j \neq i}^{N} b_{ij}, \quad i = 1, 2, \ldots, N. \tag{2}$$

Remark 1. If $\text{rank}(E) = n$, then system (1) is a general nonsingular coupled network. We will also give a sufficient condition of the finite-time synchronization for this circumstance. See Corollary 10.

Definition 2. The singular system (1) is said to be synchronized in the finite time, if for a suitable designed feedback controller, there exists a constant $t^* > 0$ (which depends on the initial vector value $x(0) = (x_1^T(0), x_2^T(0), \ldots, x_N^T(0))^T$), such that $\lim_{t \to t^*} \| x_i(t) - x_j(t) \| = 0$ and $\| x_i(t) - x_j(t) \| \equiv 0$ for $t > t^*$, $i, j = 1, 2, \ldots, N$.

Assumption 3. Assume that the singular system (1) is connected in the sense that there are no isolated clusters; that is, the matrix B is an irreducible matrix.

With Assumption 3, we obtain that zero is an eigenvalue of B with multiplicity 1, and all the other eigenvalues of B are strictly negative, which are denoted by $0 = \lambda_1 > \lambda_2 \geq \cdots \geq \lambda_N$. At the same time, since B is a symmetric matrix, there exists a unitary matrix $W = (W_1, W_2, \ldots, W_N) \in \mathbb{R}^{n \times n}$ such that $B = W\Lambda W^T$ with $WW^T = I$ and $\Lambda = \text{diag}(\lambda_1, \lambda_2, \ldots, \lambda_N)$.

Let $s(t)$ be a function to which all $x_i(t)$ are expected to synchronize in the finite time. That is, the synchronization state is $s(t)$. Suppose that $s(t)$ satisfies the equation $E\dot{s}(t) = As(t) + f(s(t), t)$. Let $e_i(t) = x_i(t) - s(t)$, $i = 1, 2, \ldots, N$. We can obtain the following singular error system:

$$E\dot{e}_i(t) = Ae_i(t) + f(x_i(t), t) - f(s(t), t)$$

$$+ c\sum_{j=1}^{N} b_{ij}(t)\Gamma e_j(t), \quad i = 1, 2, \ldots, N. \tag{3}$$

Let $e(t) = (e_1(t), e_2(t), \ldots, e_N(t))$, $y(t) = e(t)W$; then system (3) can be written as

$$E\dot{e}(t) = Ae(t) + F(e(t), t) + c\Gamma e(t)B^T,$$

$$E\dot{y}(t) = Ay(t) + F(e(t), t)W + c\Gamma y(t)\Lambda, \tag{4}$$

where $F(e(t), t) = (f(x_1(t), t) - f(s(t), t), f(x_2(t), t) - f(s(t), t), \ldots, f(x_N(t), t) - f(s(t), t))$, $y(t) = (y_1(t), y_2(t), \ldots, y_N(t))$, and $y_i(t) = e(t)W_i \in \mathbb{R}^n$, $i = 1, 2, \ldots, N$. Then, system (4) can be written as

$$E\dot{y}_i(t) = Ay_i(t) + F(e(t), t)W_i + c\lambda_i\Gamma y_i(t)$$

$$= (A + c\lambda_i\Gamma)y_i(t) + F(e(t), t)W_i. \tag{5}$$

Therefore, the finite-time synchronization problem of system (1) is equivalent to the finite-time stabilization of system (5) at the origin under the suitable controllers u_i, $i = 1, 2, \ldots, N$.

Assumption 4. Assume that there exist nonnegative constants L_i such that

$$\|f(x_i(t), t) - f(s(t), t)\| \leq L_i \|x_i(t) - s(t)\|,$$

$$i = 1, 2, \ldots, N. \tag{6}$$

Assumption 5. There exist matrices P_i such that

$$E^T P_i = P_i^T E \geq 0, \quad i = 1, 2, \ldots, N, \tag{7}$$

$$A^T P_1 + P_1^T A < 0, \tag{8}$$

$$(A + c\lambda_i\Gamma)^T P_i + P_i^T(A + c\lambda_i\Gamma) \leq -\eta_i I, \quad i = 2, \ldots, N,$$

where $\eta_i > 2L(N-1) \| P_i \|$, $L = \sum_{i=1}^{N} L_i$.

Lemma 6 (see [26]). *Suppose that the function $V(t) : [t_0, \infty) \to [0, \infty)$ is differentiable (the derivative of $V(t)$ at t_0 is in fact its right derivative) and $\dot{V}(t) \leq -K(V(t))^\alpha$, $\forall t \geq 0$, $V(t_0) \geq 0$, where $K > 0$, $0 < \alpha < 1$ are two constants. Then, for any given t_0, $V(t)$ satisfies the following inequality:*

$$V^{1-\alpha}(t) \leq V^{1-\alpha}(t_0) - K(1-\alpha)(t-t_0), \quad t_0 \leq t \leq t^*,$$

$$V(t) \equiv 0, \quad \forall t > t^*, \tag{9}$$

with t^* given by $t^* = t_0 + V^{1-\alpha}(t_0)/K(1-\alpha)$.

Lemma 7 (Jensen's Inequality). *If $a_1, a_2, \ldots, a_n$ are positive numbers and $0 < r < p$, then*

$$\left(\sum_{i=1}^{n} a_i^p \right)^{(1/p)} \leq \left(\sum_{i=1}^{n} a_i^r \right)^{(1/r)}. \tag{10}$$

3. Main Results

In this section, we consider the finite-time synchronization of the singular coupled network (1) under the appropriate controllers. In order to control the states of all nodes to the synchronization state $s(t)$ in finite time, we apply some simple controllers $u_i(t) \in \mathbb{R}^n$, $i = 1, 2, \ldots, N$, to system (1). Then, the controlled system can be written as

$$E \dot{x}_i(t) = A x_i(t) + f(x_i(t), t) + c \sum_{j=1}^{N} b_{ij} \Gamma x_j(t) + u_i, \tag{11}$$

$$i = 1, 2, \ldots, N.$$

Then, we have

$$E \dot{e}_i(t) = A e_i(t) + f(x_i(t), t) - f(s(t), t)$$

$$+ c \sum_{j=1}^{N} b_{ij} \Gamma e_j(t) + u_i, \tag{12}$$

$$E \dot{y}_i(t) = (A + c\lambda_i \Gamma) y_i(t) + F(e(t), t) W_i + v_i, \tag{13}$$

where $v_i = u W_i$, $u = (u_1, u_2, \ldots, u_N)$.

With Assumption 5, it follows from the proof of Theorem 1 in [2] and Lemma 2.2 in [3] that the pair $(E, A + c\lambda_i \Gamma)$ is regular and impulse-free; that is, there exist nonsingular matrices $M_i, Q_i \in \mathbb{R}^{n \times n}$ satisfying that

$$M_i E Q_i = \text{diag}\{I_r, 0\},$$

$$M_i (A + c\lambda_i \Gamma) Q_i = \text{diag}\{A_i, I_{n-r}\}, \tag{14}$$

where $A_i \in \mathbb{R}^{r \times r}$, $i = 1, 2, \ldots, N$. So, system (13) is equivalent to

$$\dot{y}_i^1(t) = A_i y_i^1(t) + M_i^1 F(e(t), t) W_i + M_i^1 v_i, \tag{15}$$

$$0 = y_i^2(t) + M_i^2 F(e(t), t) W_i + M_i^2 v_i, \tag{16}$$

where $Q_i^{-1} y_i(t) = \begin{pmatrix} y_i^1(t) \\ y_i^2(t) \end{pmatrix}$, $y_i^1(t) \in \mathbb{R}^r$, and $y_i^2(t) \in \mathbb{R}^{n-r}$. And $M_i = \begin{pmatrix} M_i^1 \\ M_i^2 \end{pmatrix}$, $M_i^1 \in \mathbb{R}^{r \times n}$, $M_i^2 \in \mathbb{R}^{(n-r) \times n}$, $Q_i = (Q_i^1 \ Q_i^2)$, $Q_i^1 \in \mathbb{R}^{n \times r}$, and $Q_i^2 \in \mathbb{R}^{n \times (n-r)}$.

In order to achieve our aim, we design the following controllers:

$$v_i = -k M_i^{-1} \text{sign}(M_i E e(t) W_i) |M_i E e(t) W_i|^\beta, \tag{17}$$

where

$$M_i E e(t) W_i = M_i E y_i(t) = M_i E Q_i Q_i^{-1} y_i(t)$$

$$= \begin{pmatrix} I_r & 0 \\ 0 & 0 \end{pmatrix} \begin{pmatrix} y_i^1 \\ y_i^2 \end{pmatrix} = \begin{pmatrix} y_i^1 \\ 0 \end{pmatrix},$$

$$|M_i E y_i(t)|^\beta = \left(|y_{i1}^1(t)|^\beta, \ldots, |y_{ir}^1(t)|^\beta, \underbrace{0, \ldots, 0}_{n-r} \right)^T,$$

$$\text{sign}(M_i E y_i(t)) = \text{diag}\left(\text{sign}(y_{i1}^1(t)), \text{sign}(y_{i2}^1(t)), \ldots, \right.$$

$$\left. \text{sign}(y_{ir}^1(t)), \underbrace{0, \ldots, 0}_{n-r} \right). \tag{18}$$

$k > 0$ is a tunable constant, and the real number β satisfies $0 < \beta < 1$. So, we obtain $u = (v_1, v_2, \ldots, v_N) W^{-1} = v(\xi_1, \xi_2, \ldots, \xi_N)$. That is, $u_i = v \xi_i$.

Remark 8. From (17), the controllers u_i are dependent not only on the coupled matrix B, but also on the singular matrix E. And from the shape of controllers, we only use the states y_i^1 of slow subsystems (15) in controllers v_i, but we do not consider the states y_i^2 of fast subsystems (16). It is very special. It is interesting for our future research to design more general controller which makes the singular hybrid coupled networks synchronize in finite time.

Theorem 9. *Suppose that Assumptions 3, 4, and 5 hold. Under the controllers (17), the singular system (1) is synchronized in a finite time $t^* = t_0 + (V^{(1-\beta)/2}(t_0)/ akb^{-(1+\beta)/2}(1 - \beta))$, where $V(t_0) = \sum_{i=1}^{N} y_i^T(t_0) E^T P_i y_i(t_0) = \sum_{i=1}^{N} (e(t_0) W_i)^T E^T P_i(e(t_0) W_i)$, $e(t_0)$ is the initial condition of $e(t)$, and a and b are defined as (25).*

Proof. Consider the following Lyapunov function:

$$V(t) = \sum_{i=1}^{N} y_i^T(t) E^T P_i y_i(t). \tag{19}$$

The derivative of $V(t)$ along the trajectory of system (13) is

$$\dot{V}(t)$$

$$= \sum_{i=1}^{N} \left[y_i^T(t) P_i^T \left((A + c\lambda_i \Gamma) y_i(t) + F(e(t), t) W_i + v_i \right) \right.$$

$$\left. + \left((A + c\lambda_i \Gamma) y_i(t) + F(e(t), t) W_i + v_i \right)^T P_i y_i(t) \right]$$

$$= \sum_{i=1}^{N} \left[y_i^T(t) \left(P_i^T (A + c\lambda_i \Gamma) + (A + c\lambda_i \Gamma)^T P_i \right) y_i(t) \right.$$

$$+ 2 y_i^T(t) P_i^T F(e(t), t) W_i$$

$$\left. - 2k y_i^T(t) P_i^T M_i^{-1} \text{sign}(M_i E e(t) W_i) |M_i E e(t) W_i|^\beta \right]. \tag{20}$$

By using Assumption 4, one can get the following inequality:

$$
\begin{aligned}
\left\| F\left(e\left(t\right),t\right) W_i \right\| &= \left\| \sum_{k=1}^{N} \left[f\left(x_k\left(t\right),t\right) - f\left(s\left(t\right),t\right) \right] W_{ik} \right\| \\
&\leq \sum_{k=1}^{N} L_k \left\| e_k\left(t\right) \right\| \\
&= \sum_{k=1}^{N} L_k \left\| y\left(t\right) \xi_k \right\| \leq \sum_{k=1}^{N} L_k \left\| y\left(t\right) \right\| = L \left\| y\left(t\right) \right\| \\
&\leq L \sum_{k=1}^{N} \left\| y_k\left(t\right) \right\|,
\end{aligned}
\tag{21}
$$

where $W_i = \left(W_{i1}, W_{i2}, \ldots, W_{in}\right)^T$ and $\left(\xi_1, \xi_2, \ldots, \xi_N\right) = W^{-1} = W^T$.

Define $M_i^{-T} P_i Q_i = \begin{pmatrix} P_i^1 & P_i^2 \\ P_i^3 & P_i^4 \end{pmatrix}$, where $P_i^1 \in \mathbb{R}^{r \times r}$, $P_i^2 \in \mathbb{R}^{r \times (n-r)}$, $P_i^3 \in \mathbb{R}^{(n-r) \times r}$, and $P_i^4 \in \mathbb{R}^{(n-r) \times (n-r)}$. Using (7) and (8) (see [2]), one can obtain that $P_i^1 = \left(P_i^1\right)^T > 0$ and $P_i^2 = 0$; then,

$$
V\left(t\right) = \sum_{i=1}^{N} y_i^T\left(t\right) E^T P_i y_i\left(t\right) = \sum_{i=1}^{N} \left(y_i^1\left(t\right)\right)^T P_i^1 y_i^1\left(t\right),
\tag{22}
$$

$$
\begin{aligned}
&- 2k y_i^T\left(t\right) P_i^T M_i^{-1} \,\mathrm{sign}\,\left(M_i E e\left(t\right) W_i\right) \left| M_i E e\left(t\right) W_i \right|^{\beta} \\
&= -2k y_i^T\left(t\right) P_i^T M_i^{-1} \left(\mathrm{sign}\,\left(y_{i1}^1\left(t\right)\right) \left| y_{i1}^1\left(t\right) \right|^{\beta}, \ldots, \right. \\
&\qquad\qquad\qquad \left. \mathrm{sign}\,\left(y_{ir}^1\left(t\right)\right) \left| y_{ir}^1\left(t\right) \right|^{\beta}, 0, \ldots, 0 \right) \\
&= -2k y_i^T\left(t\right) Q_i^{-T} \begin{pmatrix} P_i^1 & 0 \\ P_i^3 & P_i^4 \end{pmatrix}^T M_i M_i^{-1} \\
&\qquad \times \mathrm{diag}\,\left(\mathrm{sign}\,\left(y_i^1\left(t\right)\right), 0\right) \begin{pmatrix} \left| y_i^1\left(t\right) \right|^{\beta} \\ 0 \end{pmatrix} \\
&= -2k y_i^{1T}\left(t\right) P_i^{1T} \,\mathrm{sign}\,\left(y_i^1\left(t\right)\right) \left| y_i^1\left(t\right) \right|^{\beta} \\
&\leq -2k \lambda_{\min}\left(P_i^{1T}\right) \left| y_i^1\left(t\right) \right|^{1+\beta}.
\end{aligned}
\tag{23}
$$

Substituting (8), (21), and (23) into (20) and letting $\eta_1 = 0$, while $\eta_i \geq 2L(N-1) \| P_i \|$, $i = 2, \ldots, N$, one has

$$
\begin{aligned}
\dot{V}\left(t\right) \leq \sum_{i=1}^{N} &\left[-\eta_i \left\| y_i\left(t\right) \right\|^2 + 2L \left\| P_i \right\| \sum_{j=1}^{N} \left\| y_j\left(t\right) \right\| \left\| y_i\left(t\right) \right\| \right. \\
&\left. -2k \lambda_{\min}\left(P_i^{1T}\right) \left| y_i^1\left(t\right) \right|^{1+\beta} \right] \\
\leq \sum_{i=1}^{N} & -2k \lambda_{\min}\left(P_i^{1T}\right) \left| y_i^1\left(t\right) \right|^{1+\beta}.
\end{aligned}
\tag{24}
$$

Let

$$
a \triangleq \min_i \left\{ \lambda_{\min}\left(P_i^{1T}\right) \right\}, \qquad b \triangleq \max_i \left\{ \lambda_{\max}\left(P_i^{1T}\right) \right\}.
\tag{25}
$$

From (22), we get

$$
a \sum_{i=1}^{N} \left\| y_i^1\left(t\right) \right\|^2 \leq V\left(t\right) \leq b \sum_{i=1}^{N} \left\| y_i^1\left(t\right) \right\|^2.
\tag{26}
$$

By the use of (24)–(26) and Lemma 7, we can obtain that

$$
\begin{aligned}
\dot{V}\left(t\right) &\leq -2ak \sum_{i=1}^{N} \left| y_i^1\left(t\right) \right|^{1+\beta} \leq -2ak \left(\sum_{i=1}^{N} \left\| y_i\left(t\right) \right\|^2 \right)^{(1+\beta)/2} \\
&\leq -2ak \left(\frac{1}{b} V\left(t\right) \right)^{(1+\beta)/2} = -2ak b^{-(1+\beta)/2} \left(V\left(t\right)\right)^{(1+\beta)/2}.
\end{aligned}
\tag{27}
$$

From Lemma 6, we have that the solutions $y_i^1\left(t\right)$ of system (15) are globally asymptotically stable with respect to $y_i^1\left(t\right) = 0$ in the finite time t^*; that is,

$$
\lim_{t \to t^*} \left\| y_i^1\left(t\right) \right\| = 0, \qquad \left\| y_i^1\left(t\right) \right\| = 0 \quad \text{for } t \geq t^*,
\tag{28}
$$

where $t^* = t_0 + \left(V^{(1-\beta)/2}\left(t_0\right)/akb^{-(1+\beta)/2}\left(1 - \beta\right)\right)$.

In the following, we show that $y_i^2\left(t\right)$ are globally asymptotically stable with respect to $y_i^2\left(t\right) = 0$ in the finite time t^*. From (16), one has

$$
\left\| y_i^2\left(t\right) \right\| \leq \left\| M_i^2 \right\| \left\| F\left(e\left(t\right),t\right) W_i \right\| + \left\| M_i^2 \right\| \left\| v_i \right\|.
\tag{29}
$$

Similar to the proof of Lemma 2.2 in [3] and the proof of Theorem 1 in [17], let $M_i^2 \left(M_i^2\right)^T = I_{n-r}$, which implies that $\| M_i^2 \| = 1$. One has

$$
\begin{aligned}
\left\| y_i^2\left(t\right) \right\| &\leq \left\| F\left(e\left(t\right),t\right) W_i \right\| + \left\| u_i W_i \right\| \\
&\leq L \sum_{j=1}^{N} \left\| y_j\left(t\right) \right\| + \left\| -k M_i^{-1} \,\mathrm{sign}\,\left(M_i E y_i\left(t\right)\right) \right. \\
&\qquad\qquad\qquad\qquad \left. \times \left| M_i E y_i\left(t\right) \right|^{\beta} \right\| \\
&\leq L \sum_{j=1}^{N} \left\| Q_j \right\| \left(\left\| y_j^1\left(t\right) \right\| + \left\| y_j^2\left(t\right) \right\| \right) + k \left\| M_i^{-1} \right\| \\
&\qquad \times \left| y_i^1\left(t\right) \right|^{\beta}.
\end{aligned}
\tag{30}
$$

Then,

$$
\begin{aligned}
\sum_{i=1}^{N} \left\| y_i^2\left(t\right) \right\| \leq \sum_{i=1}^{N} &\left[L \sum_{j=1}^{N} \left\| Q_j \right\| \left(\left\| y_j^1\left(t\right) \right\| + \left\| y_j^2\left(t\right) \right\| \right) \right. \\
&\left. + k \left\| M_i^{-1} \right\| \left| y_i^1\left(t\right) \right|^{\beta} \right];
\end{aligned}
\tag{31}
$$

that is,

$$\sum_{i=1}^{N} \left(1 - NL \|Q_i\|\right) \|y_i^2(t)\| \le \sum_{i=1}^{N} \left(NL \|Q_i\| \|y_j^1(t)\| \right.$$

$$\left. + k \|M_i^{-1}\| \left| y_i^1(t) \right|^{\beta} \right). \tag{32}$$

With Assumption 4, there must exist nonsingular matrices $M_i, Q_i \in \mathbb{R}^{n \times n}$ satisfying the equalities $M_i E Q_i = \mathrm{diag}\{I_r, 0\}$, $M_i(A + c\lambda_i\Gamma)Q_i = \mathrm{diag}\{A_i, I_{n-r}\}$, where $A_i \in \mathbb{R}^{r \times r}$, $i = 1, 2, \ldots, N$. Moreover, nonsingular matrices Q_i can be suitably chosen to satisfy $1 - NL \| Q_i \| > 0$, for $\forall i \in \{1, 2, \ldots, N\}$. Therefore, one can obtain $\lim_{t \to t^*} \| y_i^2(t) \| = 0$, and $\| y_i^2(t) \| = 0$ for $t \ge t^*$ from (28) and (32), $i = 1, 2, \ldots, N$. Consequently, $\lim_{t \to t^*} \| e_i(t) \| = 0$, and $\| e_i(t) \| = 0$ for $t \ge t^*$, $i = 1, 2, \ldots, N$. The proof is completed. □

If $\mathrm{rank}(E) = n$, system (1) is a general nonsingular coupled network. By using the controllers u_i similar to v_i in (17), we can derive the finite-time synchronization of system (1). For simplicity, let $E = I_n$. Then, we have the following.

Corollary 10. *When $E = I_n$, under Assumptions 3 and 4, let the controllers $u_i(t)$ be as follows:*

$$u_i(t) = -k \, \mathrm{sign}\left(e_i(t)\right) \left| e_i(t) \right|^{\beta}, \quad i = 1, 2, \ldots, N; \tag{33}$$

system (1) is synchronized in a finite time.

Remark 11. Since the conditions in Assumption 5 are not strict LMIs problems, they cannot be solved directly by the LMI Matlab Toolbox. According to Lemma 1 in [17], Lemma 1 in [9], and Remark 3 in [18], if matrix E has the decomposition as

$$E = U \begin{pmatrix} I_r & 0 \\ 0 & 0 \end{pmatrix} \begin{pmatrix} \Xi_r & 0 \\ 0 & I_{n-r} \end{pmatrix} V^T, \tag{34}$$

where $U = (U_1, U_2)$, $V = (V_1, V_2)$, and $\Xi_r = \mathrm{diag}\{\varrho_1, \ldots, \varrho_r\}$ with $\varrho_i > 0$ for $i = 1, 2, \ldots, r$, then Assumption 5 can be transformed into a strict LMIs problem.

Corollary 12. *Suppose that Assumptions 3 and 4 hold, and matrix E has the decomposition as (34) in Remark 11. By the controllers (17), the singular hybrid coupled network (1) can be synchronized in the finite time in the sense of Definition 2, if there exist matrices $T_i \in \mathbb{R}^{r \times r}$, $T_i \ge 0$, and $S_i \in \mathbb{R}^{(n-r) \times r}$, $i = 1, 2, \ldots, N$, such that*

$$A^T \left(U_1 T_1 U_1^T E + U_2 S_1\right) + \left(U_1 T_1 U_1^T E + U_2 S_1\right)^T A < 0,$$

$$\left(A + c\lambda_i\Gamma\right)^T \left(U_1 T_i U_1^T E + U_2 S_i\right) \tag{35}$$

$$+ \left(U_1 T_i U_1^T E + U_2 S_i\right)^T \left(A + c\lambda_i\Gamma\right) \le -\eta_i I,$$

where $\eta_i > 2L(N-1) \| P_i \|$, $P_i = (U_1 T_i U_1^T E + U_2 S_i)$, $i = 2, \ldots, N$, and $L = \sum_{i=1}^{N} L_i$.

Suppose that we choose the average state of all node states as synchronized state; that is, $s(t) = (1/N) \sum_{k=1}^{N} x_k(t)$. We have similar results. Before giving these results, we need some assumptions as follows:

Assumption 2′. Assume that there exist nonnegative constants L_{ij} such that

$$\left\| f\left(x_i(t), t\right) - f\left(x_j(t), t\right) \right\| \le L_{ij} \left\| x_i(t) - x_j(t) \right\|,$$

$$i, j = 1, 2, \ldots, N. \tag{36}$$

Assumption 3′. There exist matrices P_i such that

$$E^T P_i = P_i^T E \ge 0, \quad i = 1, 2, \ldots, N,$$

$$A^T P_1 + P_1^T A < 0,$$

$$\left(A + c\lambda_i\Gamma\right)^T P_i + P_i^T \left(A + c\lambda_i\Gamma\right) \le -\varsigma_i I, \tag{37}$$

$$i = 2, \ldots, N,$$

where $\varsigma_i > (4L/N)(N-1) \| P_i \|$, $L = \sum_{i=1}^{N} L_i$, and $L_i = \sum_{k=1, k \ne i}^{N} L_{ik}$.

Theorem 13. *Suppose that Assumptions 3, 2′, and 3′ hold. By the controllers (17), the singular hybrid coupled network (1) can be synchronized to the average state of all node states in the finite time in the sense of Definition 2.*

Corollary 14. *Suppose that Assumptions 3 and 2′ hold, and matrix E has the decomposition as (34) in Remark 11. By the controllers (17), if there exist matrices $T_i \in \mathbb{R}^{r \times r}$, $T_i \ge 0$, and $S_i \in \mathbb{R}^{(n-r) \times r}$, $i = 1, 2, \ldots, N$, such that*

$$A^T \left(U_1 T_1 U_1^T E + U_2 S_1\right) + \left(U_1 T_1 U_1^T E + U_2 S_1\right)^T A < 0,$$

$$\left(A + c\lambda_i\Gamma\right)^T \left(U_1 T_i U_1^T E + U_2 S_i\right) \tag{38}$$

$$+ \left(U_1 T_i U_1^T E + U_2 S_i\right)^T \left(A + c\lambda_i\Gamma\right) \le -\eta_i I,$$

where $\eta_i > (4L/N)(N-1) \| P_i \|$, $P_i = (U_1 T_i U_1^T E + U_2 S_i)$, $i = 2, \ldots, N$, $L = \sum_{i=1}^{N} L_i$, and $L_i = \sum_{k=1, k \ne i}^{N} L_{ik}$, the singular hybrid coupled network (1) can be synchronized to the average state of all node states in the finite time.

Remark 15. In this paper, we study finite-time synchronization of the singular hybrid coupled networks when the singular systems studied in this paper are assumed to be regular and impulse-free. However, it may be more complicated when we do not assume in advance that the systems are regular and impulse free. Synchronization or finite-time synchronization of singular coupled systems is worth discussing without the assumption that the considered systems are regular and impulsive free.

4. An Illustrative Example

In this section, a numerical example will be given to verify the theoretical results obtained earlier.

Example 16. Consider the following singular hybrid coupled network which is similar to one given in [18]:

$$E\dot{x}_i(t) = Ax_i(t) + f(x_i(t), t) + c\sum_{j=1}^{6} b_{ij}\Gamma x_j(t) + u_i,$$

(39)

$$i = 1, 2, \ldots, 6,$$

where $x_i(t) = (x_i^1(t), x_i^2(t))^T$, $f(x_i(t), t) = ((1/15)\tanh(x_i^1(t)), \tanh(x_i^2(t)))^T$, $s(t) = (0, 0)^T$, $L_i = 1/15$, $L = 2/5$, $c = 1$, and

$$E = \begin{pmatrix} 8 & 0 \\ 0 & 0 \end{pmatrix}, \qquad A = \begin{pmatrix} -10 & 1 \\ 1 & -10 \end{pmatrix}, \qquad \Gamma = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix},$$

$$B = \begin{pmatrix} -5 & 1 & 1 & 1 & 1 & 1 \\ 1 & -4 & 1 & 1 & 1 & 0 \\ 1 & 1 & -4 & 1 & 0 & 1 \\ 1 & 1 & 1 & -4 & 1 & 0 \\ 1 & 1 & 0 & 1 & -4 & 1 \\ 1 & 0 & 1 & 0 & 1 & -3 \end{pmatrix}.$$

(40)

Since B is symmetric matrix and its six eigenvalues are $\lambda_1 = 0$, $\lambda_2 = -3$, $\lambda_3 = -4$, $\lambda_4 = -5$, $\lambda_5 = -6$, and $\lambda_6 = -6$, there exists a unitary matrix

$$W = (W_1, \ldots, W_6)$$

$$= \begin{pmatrix} -\dfrac{1}{\sqrt{6}} & 0 & 0 & 0 & -\dfrac{1}{\sqrt{6}} & -\dfrac{2}{\sqrt{6}} \\[6pt] -\dfrac{1}{\sqrt{6}} & \dfrac{1}{\sqrt{6}} & 0 & -\dfrac{1}{\sqrt{2}} & \dfrac{1}{\sqrt{6}} & 0 \\[6pt] -\dfrac{1}{\sqrt{6}} & 0 & -\dfrac{1}{\sqrt{2}} & 0 & -\dfrac{1}{\sqrt{6}} & \dfrac{1}{\sqrt{6}} \\[6pt] -\dfrac{1}{\sqrt{6}} & \dfrac{1}{\sqrt{6}} & 0 & \dfrac{1}{\sqrt{2}} & \dfrac{1}{\sqrt{6}} & 0 \\[6pt] -\dfrac{1}{\sqrt{6}} & 0 & \dfrac{1}{\sqrt{2}} & 0 & -\dfrac{1}{\sqrt{6}} & \dfrac{1}{\sqrt{6}} \\[6pt] -\dfrac{1}{\sqrt{6}} & -\dfrac{2}{\sqrt{6}} & 0 & 0 & \dfrac{1}{\sqrt{6}} & 0 \end{pmatrix}$$

(41)

such that $B = W\Lambda W^T$ and $\Lambda = \text{diag}(0, -3, -4, -5, -6, -6)$.

Choose

$$M_i = \begin{pmatrix} 1 & \dfrac{1}{10 - \lambda_i} \\ 0 & 1 \end{pmatrix}, \qquad Q_i = \begin{pmatrix} \dfrac{1}{8} & 0 \\ \dfrac{1}{8(10 - \lambda_i)} & \dfrac{1}{\lambda_i - 10} \end{pmatrix},$$

$$P_i = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix},$$

(42)

$\eta_i > 4$, $i = 1, 2, \ldots, 6$, and $\beta = 1/2$ satisfying Assumptions 3, 4, and 5. Under the controllers u_i defined in Theorem 9, the singular hybrid system (39) can be synchronized in the finite time $t^* = 7.1858$ according to Theorem 9 if $k = 1$. If the controller gain $k = 5$, $t^* = 1.4372$. Corresponding simulation results are shown in Figures 1 and 2 with initial conditions $e(0) = \left(\begin{smallmatrix} 1 & 3 & 2 & 0.7 & 2.5 & 0.3 \\ 0.5 & -1 & 0.8 & -2 & 1.5 & -0.5 \end{smallmatrix}\right)$.

FIGURE 1: Error variable $e_i^1(t)$ ($i = 1, 2, \ldots, 6$) of system (39) with $k = 1$.

FIGURE 2: Error variable $e_i^2(t)$ ($i = 1, 2, \ldots, 6$) of system (39) with $k = 1$.

5. Conclusions

In this paper, we discuss finite-time synchronization of the singular hybrid coupled networks with the assumption that the considered singular systems are regular and impulsive-free. Some sufficient conditions are derived to ensure finite-time synchronization of the singular hybrid coupled networks under a state feedback controller by finite-time stability theory. A numerical example is finally exploited to show the effectiveness of the obtained results. It will be an interesting topic for the future researches to extend new methods to study synchronization, robust control, pinning control, and finite-time synchronization of singular hybrid coupled networks without the assumption that the considered singular systems are regular and impulsive-free.
