## 1. Introduction

Let $X$ and $Y$ be metric spaces. A mapping $f: X \rightarrow Y$ is called an isometry if $f$ satisfies

$$
\begin{equation*}
d_{Y}(f(x), f(y))=d_{X}(x, y) \tag{1.1}
\end{equation*}
$$

for all $x, y \in X$, where $d_{X}(\cdot, \cdot)$ and $d_{Y}(\cdot, \cdot)$ denote the metrics in the spaces $X$ and $Y$, respectively. For some fixed number $r>0$, suppose that $f$ preserves distance $r$, that is, for all $x, y$ in $X$ with $d_{X}(x, y)=r$, we have $d_{Y}(f(x), f(y))=r$. Then $r$ is called a conservative (or preserved) distance for the mapping $f$. Aleksandrov [1] posed the following problem.

Aleksandrov problem. Examine whether the existence of a single conservative distance for some mapping $T$ implies that $T$ is an isometry.

The Aleksandrov problem has been investigated in several papers (see [2, 3, 6-9, 13$15,20,23,26,28])$. Rassias and Šemrl [25] proved the following theorem for mappings satisfying the strong distance one preserving property (SDOPP), that is, for every $x, y \in X$ with $\|x-y\|=1$ it follows that $\|f(x)-f(y)\|=1$ and conversely.

Theorem 1.1 [25]. Let $X$ and $Y$ be real normed linear spaces such that one of them has dimension greater than one. Suppose that $f: X \rightarrow Y$ is a Lipschitz mapping with Lipschitz constant $\kappa \leq 1$. Assume that $f$ is a surjective mapping satisfying SDOPP. Then $f$ is an isometry.

Definition 1.2 [4]. Let $X$ be a real linear space with $\operatorname{dim} X \geq N$ and $\|\cdot, \ldots, \cdot\|: X^{N} \rightarrow \mathbb{R}$ a function. Then $(X,\|\cdot, \ldots, \cdot\|)$ is called a linear $N$-normed space if
$\left(\mathrm{N}_{1}\right)\left\|x_{1}, \ldots, x_{N}\right\|=0 \Leftrightarrow x_{1}, \ldots, x_{N}$ are linearly dependent;
$\left(\mathrm{N}_{2}\right)\left\|x_{1}, \ldots, x_{N}\right\|=\left\|x_{j_{1}}, \ldots, x_{j_{N}}\right\|$ for every permutation $\left(j_{1}, \ldots, j_{N}\right)$ of $(1, \ldots, N)$;
$\left(\mathrm{N}_{3}\right)\left\|\alpha x_{1}, \ldots, x_{N}\right\|=|\alpha|\left\|x_{1}, \ldots, x_{N}\right\|$;
$\left(\mathrm{N}_{4}\right)\left\|x+y, x_{2}, \ldots, x_{N}\right\| \leq\left\|x, x_{2}, \ldots, x_{n}\right\|+\left\|y, x_{2}, \ldots, x_{N}\right\|$
for all $\alpha \in \mathbb{R}$ and all $x, y, x_{1}, \ldots, x_{N} \in X$. The function $\|\cdot, \ldots, \cdot\|$ is called the $N$-norm on $X$.
Note that the notion of 1-norm is the same as that of norm.
In [18], it was defined the notion of $n$-isometry and proved the Rassias and Šemrl's theorem in linear $N$-normed spaces.

Definition 1.3 [18]. $f: X \rightarrow Y$ is called an $N$-Lipschitz mapping if there is a $\kappa \geq 0$ such that

$$
\begin{equation*}
\left\|f\left(x_{1}\right)-f\left(y_{1}\right), \ldots, f\left(x_{N}\right)-f\left(y_{N}\right)\right\| \leq \kappa\left\|x_{1}-y_{1}, \ldots, x_{N}-y_{N}\right\| \tag{1.2}
\end{equation*}
$$

for all $x_{1}, \ldots, x_{N}, y_{1}, \ldots, y_{N} \in X$. The smallest such $\kappa$ is called the $N$-Lipschitz constant.
Definition 1.4 [18]. Let $X$ and $Y$ be linear $N$-normed spaces and $f: X \rightarrow Y$ a mapping. $f$ is called an $N$-isometry if

$$
\begin{equation*}
\left\|x_{1}-y_{1}, \ldots, x_{N}-y_{N}\right\|=\left\|f\left(x_{1}\right)-f\left(y_{1}\right), \ldots, f\left(x_{N}\right)-f\left(y_{N}\right)\right\| \tag{1.3}
\end{equation*}
$$

for all $x_{1}, \ldots, x_{N}, y_{1}, \ldots, y_{N} \in X$.
For a mapping $f: X \rightarrow Y$, consider the following condition which is called the $N$ distance one preserving property: for $x_{1}, \ldots, x_{N}, y_{1}, \ldots, y_{N} \in X$ with $\| x_{1}-y_{1}, \ldots, x_{N}-$ $y_{N}\|=1\| f,\left(x_{1}\right)-f\left(y_{1}\right), \ldots, f\left(x_{N}\right)-f\left(y_{N}\right) \|=1$.
Definition 1.5 [5]. The points $x, y, z \in X$ are said to be colinear if $x-y$ and $x-z$ are linearly dependent.

Theorem 1.6 [18, Theorem 2.7]. Let $f: X \rightarrow Y$ be an $N$-Lipschitz mapping with $N$-Lipschitz constant $\kappa \leq 1$. Assume that if $x, y, z$ are colinear, then $f(x), f(y), f(z)$ are colinear, and that if $x_{1}-y_{1}, \ldots, x_{N}-y_{N}$ are linearly dependent, then $f\left(x_{1}\right)-f\left(y_{1}\right), \ldots, f\left(x_{N}\right)-$ $f\left(y_{N}\right)$ are linearly dependent. If $f$ satisfies the $N$-distance one preserving property, then $f$ is an $N$-isometry.

Let $X$ and $Y$ be Banach spaces with norms $\|\cdot\|$ and $\|\cdot\|$, respectively. Consider $f: X \rightarrow Y$ to be a mapping such that $f(t x)$ is continuous in $t \in \mathbb{R}$ for each fixed $x \in X$. Rassias [19] introduced the following inequality: assume that there exist constants $\theta \geq 0$ and $p \in[0,1)$ such that

$$
\begin{equation*}
\|f(x+y)-f(x)-f(y)\| \leq \theta\left(\|x\|^{p}+\|y\|^{p}\right) \tag{*}
\end{equation*}
$$

for all $x, y \in X$. Rassias [19] showed that there exists a unique $\mathbb{R}$-linear mapping $T: X \rightarrow$ $Y$ such that

$$
\begin{equation*}
\|f(x)-T(x)\| \leq \frac{2 \theta}{2-2^{p}}\|x\|^{p} \tag{1.4}
\end{equation*}
$$

for all $x \in X$. The inequality $(*)$ has provided a lot of influence in the development of what is known as generalized Hyers-Ulam stability of functional equations. Beginning around the year 1980, the topic of approximate homomorphisms, or the stability of the equation of homomorphism, was studied by a number of mathematicians (see [10-12, 16, 21, 22, 24]).

Trif [27] proved that, for vector spaces $X$ and $Y$, a mapping $f: X \rightarrow Y$ with $f(0)=0$ satisfies the functional equation

$$
\begin{equation*}
d_{d-2} C_{l-2} f\left(\frac{x_{1}+\cdots+x_{d}}{d}\right)+{ }_{d-2} C_{l-1} \sum_{i=1}^{d} f\left(x_{i}\right)=d \sum_{1 \leq i_{1}<\cdots<i_{l} \leq d} f\left(\frac{x_{i_{1}}+\cdots+x_{i l}}{l}\right) \tag{T}
\end{equation*}
$$

for all $x_{1}, \ldots, x_{d} \in X$ if and only if the mapping $f: X \rightarrow Y$ satisfies the Cauchy additive equation $f(x+y)=f(x)+f(y)$ for all $x, y \in X$. Here ${ }_{d} C_{l}:=d!/ l!(d-l)!$. He proved the stability of the functional equation (T) (see [27, Theorems 3.1 and 3.2]).

In [17], it was proved that, for vector spaces $X$ and $Y$, a mapping $f: X \rightarrow Y$ with $f(0)=0$ satisfies the functional equation

$$
\begin{align*}
& m n_{m n-2} C_{k-2} f\left(\frac{x_{1}+\cdots+x_{m n}}{m n}\right)+m_{m n-2} C_{k-1} \sum_{i=1}^{n} f\left(\frac{x_{m i-m+1}+\cdots+x_{m i}}{m}\right)  \tag{P}\\
& \quad=k \sum_{1 \leq i_{1}<\cdots<i_{k} \leq m n} f\left(\frac{x_{i_{1}}+\cdots+x_{i_{k}}}{k}\right)
\end{align*}
$$

for all $x_{1}, \ldots, x_{m n} \in X$ if and only if the mapping $f: X \rightarrow Y$ satisfies the Cauchy additive equation $f(x+y)=f(x)+f(y)$ for all $x, y \in X$.

In this paper, we introduce the concept of linear $N$-normed Banach space, and we prove the generalized Hyers-Ulam stability of additive $N$-isometries on linear $N$-normed Banach spaces.

## 2. Generalized Hyers-Ulam stability of additive $N$-isometries on linear $N$-normed Banach spaces

We define the notion of linear $N$-normed Banach space.
Definition 2.1. A linear $N$-normed and normed space $X$ with $N$-norm $\|\cdot, \ldots, \cdot\|_{X}$ and norm $\|\cdot\|$ is called a linear $N$-normed Banach space if $(X,\|\cdot\|)$ is a Banach space.

In this section, assume that $X$ is a linear $N$-normed Banach space with $N$-norm $\|\cdot, \ldots, \cdot\|_{X}$ and norm $\|\cdot\|$, and that $Y$ is a linear $N$-normed Banach space with $N$-norm $\|\cdot, \ldots, \cdot\|_{Y}$ and norm $\|\cdot\|$.

Assume that $1 \leq N \leq d$. Note that the notion of " 1 -isomery" is the same as that of "isometry."

Let $q=l(d-1) /(d-l)$ and $r=-l /(d-l)$ for positive integers $l, d$ with $2 \leq l \leq d-1$.
Theorem 2.2. Let $f: X \rightarrow Y$ be a mapping with $f(0)=0$ for which there exists a function $\varphi: X^{d} \rightarrow[0, \infty)$ such that

$$
\begin{gather*}
\tilde{\varphi}\left(x_{1}, \ldots, x_{d}\right):=\sum_{j=0}^{\infty} \frac{1}{q^{j}} \varphi\left(q^{j} x_{1}, \ldots, q^{j} x_{d}\right)<\infty,  \tag{2.1}\\
\| d_{d-2} C_{l-2} f\left(\frac{x_{1}+\cdots+x_{d}}{d}\right)+{ }_{d-2} C_{l-1} \sum_{j=1}^{d} f\left(x_{j}\right)  \tag{2.2}\\
-l \sum_{1 \leq j_{1}<\cdots<j_{l} \leq d} f\left(\frac{x_{j_{1}}+\cdots+x_{j_{l}}}{l}\right) \| \leq \varphi\left(x_{1}, \ldots, x_{d}\right), \\
\left|\left\|f\left(x_{1}\right), \ldots, f\left(x_{N}\right)\right\|_{Y}-\left\|x_{1}, \ldots, x_{N}\right\|_{X}\right| \leq \varphi(x_{1}, \ldots, x_{N}, \underbrace{0, \ldots, 0}_{d-N \text { times }}) \tag{2.3}
\end{gather*}
$$

for all $x_{1}, \ldots, x_{d} \in X$. Then there exists a unique additive $N$-isometry $U: X \rightarrow Y$ such that

$$
\begin{equation*}
\|f(x)-U(x)\| \leq \frac{1}{l_{d-1} C_{l-1}} \tilde{\varphi}(q x, \underbrace{r x, \ldots, r x}_{d-1 \text { times }}) \tag{2.4}
\end{equation*}
$$

for all $x \in X$.
Proof. By the Trif's theorem [27, Theorem 3.1], it follows from (2.1) and (2.2) that there exists a unique additive mapping $U: X \rightarrow Y$ satisfying (2.4). The additive mapping $U: X \rightarrow Y$ is given by

$$
\begin{equation*}
U(x)=\lim _{b \rightarrow \infty} \frac{1}{q^{b}} f\left(q^{b} x\right) \tag{2.5}
\end{equation*}
$$

for all $x \in X$.
It follows from (2.3) that

$$
\begin{align*}
& \left|\left\|\frac{1}{q^{b}} f\left(q^{b} x_{1}\right), \ldots, \frac{1}{q^{b}} f\left(q^{b} x_{N}\right)\right\|_{Y}-\left\|x_{1}, \ldots, x_{N}\right\|_{X}\right| \\
& \quad=\frac{1}{q^{b N}}\left|\left\|f\left(q^{b} x_{1}\right), \ldots, f\left(q^{b} x_{N}\right)\right\|_{Y}-\left\|q^{b} x_{1}, \ldots, q^{b} x_{N}\right\|_{X}\right| \\
& \quad \leq \frac{1}{q^{b N}} \varphi(q^{b} x_{1}, \ldots, q^{b} x_{N}, \underbrace{0, \ldots, 0}_{d-N \text { times }})  \tag{2.6}\\
& \quad \leq \frac{1}{q^{b}} \varphi(q^{b} x_{1}, \ldots, q^{b} x_{N}, \underbrace{0, \ldots, 0}_{d-N \text { times }}),
\end{align*}
$$

which tends to zero as $b \rightarrow \infty$ for all $x_{1}, \ldots, x_{N} \in X$ by (2.1). By (2.5),

$$
\begin{equation*}
\left\|U\left(x_{1}\right), \ldots, U\left(x_{N}\right)\right\|_{Y}=\lim _{b \rightarrow \infty}\left\|\frac{1}{q^{b}} f\left(q^{b} x_{1}\right), \ldots, \frac{1}{q^{b}} f\left(q^{b} x_{N}\right)\right\|_{Y}=\left\|x_{1}, \ldots, x_{N}\right\|_{X} \tag{2.7}
\end{equation*}
$$

for all $x_{1}, \ldots, x_{N} \in X$. Since $U: X \rightarrow Y$ is additive,

$$
\begin{align*}
& \left\|U\left(x_{1}\right)-U\left(y_{1}\right), \ldots, U\left(x_{N}\right)-U\left(y_{N}\right)\right\|_{Y} \\
& \quad=\left\|U\left(x_{1}-y_{1}\right), \ldots, U\left(x_{N}-y_{N}\right)\right\|_{Y}=\left\|x_{1}-y_{1}, \ldots, x_{N}-y_{N}\right\|_{X} \tag{2.8}
\end{align*}
$$

for all $x_{1}, y_{1}, \ldots, x_{N}, y_{N} \in X$. So the additive mapping $U: X \rightarrow Y$ is an $N$-isometry, as desired.

Corollary 2.3. Let $f: X \rightarrow Y$ be a mapping with $f(0)=0$ for which there exist constants $\theta \geq 0$ and $p \in[0,1)$ such that

$$
\begin{align*}
& \| d_{d-2} C_{l-2} f\left(\frac{x_{1}+\cdots+x_{d}}{d}\right)+{ }_{d-2} C_{l-1} \sum_{j=1}^{d} f\left(x_{j}\right) \\
& -l \sum_{1 \leq j_{1}<\cdots<j_{l} \leq d} f\left(\frac{x_{j_{1}}+\cdots+x_{j_{l}}}{l}\right)\left\|\leq \theta \sum_{j=1}^{d}\right\| x_{j} \|^{p},  \tag{2.9}\\
& \left|\left\|f\left(x_{1}\right), \ldots, f\left(x_{N}\right)\right\|_{Y}-\left\|x_{1}, \ldots, x_{N}\right\|_{X}\right| \leq \theta \sum_{j=1}^{N}\left\|x_{j}\right\|^{p}
\end{align*}
$$

for all $x_{1}, \ldots, x_{d} \in X$. Then there exists a unique additive $N$-isometry $U: X \rightarrow Y$ such that

$$
\begin{equation*}
\|f(x)-U(x)\| \leq \frac{q^{1-p}\left(q^{p}+(d-1) r^{p}\right) \theta}{l_{d-1} C_{l-1}\left(q^{1-p}-1\right)}\|x\|^{p} \tag{2.10}
\end{equation*}
$$

for all $x \in X$.
Proof. Define $\varphi\left(x_{1}, \ldots, x_{d}\right)=\theta \sum_{j=1}^{d}\left\|x_{j}\right\|^{p}$, and apply Theorem 2.2.
From now on, let $q=l(d-1) /(d-l)$ and $r=-1 /(d-1)$ for positive integers $l, d$ with $2 \leq l \leq d-1$.

Theorem 2.4. Let $f: X \rightarrow Y$ be a mapping with $f(0)=0$ for which there exists a function $\varphi: X^{d} \rightarrow[0, \infty)$ satisfying (2.2) and (2.3) such that

$$
\begin{equation*}
\sum_{j=0}^{\infty} q^{N j} \varphi\left(\frac{x_{1}}{q^{j}}, \ldots, \frac{x_{d}}{q^{j}}\right)<\infty \tag{2.11}
\end{equation*}
$$

for all $x_{1}, \ldots, x_{d} \in X$. Then there exists a unique additive $N$-isometry $U: X \rightarrow Y$ such that

$$
\begin{equation*}
\|f(x)-U(x)\| \leq \frac{1}{d-2 C_{l-1}} \tilde{\varphi}(x, \underbrace{r x, \ldots, r x}_{d-1 \text { times }}) \tag{2.12}
\end{equation*}
$$

6 Journal of Inequalities and Applications
for all $x \in X$, where

$$
\begin{equation*}
\tilde{\varphi}\left(x_{1}, \ldots, x_{d}\right):=\sum_{j=0}^{\infty} q^{j} \varphi\left(\frac{x_{1}}{q^{j}}, \ldots, \frac{x_{d}}{q^{j}}\right) \tag{2.13}
\end{equation*}
$$

for all $x_{1}, \ldots, x_{d} \in X$.
Proof. Note that

$$
\begin{equation*}
q^{j} \varphi\left(\frac{x_{1}}{q^{j}}, \ldots, \frac{x_{d}}{q^{j}}\right) \leq q^{N j} \varphi\left(\frac{x_{1}}{q^{j}}, \ldots, \frac{x_{d}}{q^{j}}\right) \tag{2.14}
\end{equation*}
$$

for all $x_{1}, \ldots, x_{d} \in X$ and all positive integers $j$. By the Trif's theorem [27, Theorem 3.2], it follows from (2.2), (2.11), and (2.14) that there exists a unique additive mapping $U$ : $X \rightarrow Y$ satisfying (2.12). The additive mapping $U: X \rightarrow Y$ is given by

$$
\begin{equation*}
U(x)=\lim _{b \rightarrow \infty} q^{b} f\left(\frac{x}{q^{b}}\right) \tag{2.15}
\end{equation*}
$$

for all $x \in X$.
It follows from (2.3) that

$$
\begin{align*}
& \left\|\left\|q^{b} f\left(\frac{x_{1}}{q^{b}}\right), \ldots, q^{b} f\left(\frac{x_{N}}{q^{b}}\right)\right\|_{Y}-\right\| x_{1}, \ldots, x_{N} \|_{X} \mid \\
& \quad=q^{b N}\left|\left\|f\left(\frac{x_{1}}{q^{b}}\right), \ldots, f\left(\frac{x_{N}}{q^{b}}\right)\right\|_{Y}-\left\|\frac{x_{1}}{q^{b}}, \ldots, \frac{x_{N}}{q^{b}}\right\|_{X}\right|  \tag{2.16}\\
& \quad \leq q^{b N} \varphi(\frac{x_{1}}{q^{b}}, \ldots, \frac{x_{N}}{q^{b}}, \underbrace{0, \ldots, 0}_{d-N \text { times }})
\end{align*}
$$

which tends to zero as $b \rightarrow \infty$ for all $x_{1}, \ldots, x_{N} \in X$ by (2.11). By (2.15),

$$
\begin{equation*}
\left\|U\left(x_{1}\right), \ldots, U\left(x_{N}\right)\right\|_{Y}=\lim _{b \rightarrow \infty}\left\|q^{b} f\left(\frac{x_{1}}{q^{b}}\right), \ldots, q^{b} f\left(\frac{x_{N}}{q^{b}}\right)\right\|_{Y}=\left\|x_{1}, \ldots, x_{N}\right\|_{X} \tag{2.17}
\end{equation*}
$$

for all $x_{1}, \ldots, x_{N} \in X$. Since $U: X \rightarrow Y$ is additive,

$$
\begin{align*}
& \left\|U\left(x_{1}\right)-U\left(y_{1}\right), \ldots, U\left(x_{N}\right)-U\left(y_{N}\right)\right\|_{Y} \\
& \quad=\left\|U\left(x_{1}-y_{1}\right), \ldots, U\left(x_{N}-y_{N}\right)\right\|_{Y}=\left\|x_{1}-y_{1}, \ldots, x_{N}-y_{N}\right\|_{X} \tag{2.18}
\end{align*}
$$

for all $x_{1}, y_{1}, \ldots, x_{N}, y_{N} \in X$. So the additive mapping $U: X \rightarrow Y$ is an $N$-isometry, as desired.
Corollary 2.5. Let $f: X \rightarrow Y$ be a mapping with $f(0)=0$ for which there exist constants $\theta \geq 0$ and $p \in(N, \infty)$ satisfying (2.9). Then there exists a unique additive $N$-isometry $U$ : $X \rightarrow Y$ such that

$$
\begin{equation*}
\|f(x)-U(x)\| \leq \frac{\left(1+(d-1) r^{p}\right) \theta}{d-2 C_{l-1}\left(1-q^{1-p}\right)}\|x\|^{p} \tag{2.1}
\end{equation*}
$$

for all $x \in X$.

Proof. Define $\varphi\left(x_{1}, \ldots, x_{d}\right)=\theta \sum_{j=1}^{d}\left\|x_{j}\right\|^{p}$, and apply Theorem 2.4.
Similarly, we can prove the corresponding results for the case $N>d$.
Now, assume that $m, n, k$ are integers with $1<m<k<m n$, and that $s, q$ are integers with $1 \leq s \leq[n / 2]$ and $1<2 q \leq m$, where [•] denotes the Gauss symbol. Assume that $1 \leq N \leq m n$.

Theorem 2.6. Let $f: X \rightarrow Y$ be a mapping with $f(0)=0$ for which there exists a function $\varphi: X^{m n} \rightarrow[0, \infty)$ such that

$$
\begin{gather*}
\tilde{\varphi}\left(x_{1}, \ldots, x_{m n}\right):=\sum_{j=0}^{\infty} \frac{1}{2^{j}} \varphi\left(2^{j} x_{1}, \ldots, 2^{j} x_{m n}\right)<\infty,  \tag{2.20}\\
\| m n_{m n-2} C_{k-2} f\left(\frac{x_{1}+\cdots+x_{m n}}{m n}\right)+m_{m n-2} C_{k-1} \sum_{i=1}^{n} f\left(\frac{x_{m i-m+1}+\cdots+x_{m i}}{m}\right) \\
-k \sum_{1 \leq i_{1}<\cdots<i_{k} \leq m n} f\left(\frac{x_{i_{1}}+\cdots+x_{i_{k}}}{k}\right) \| \leq \varphi\left(x_{1}, \ldots, x_{m n}\right),  \tag{2.21}\\
\left\|\left\|f\left(x_{1}\right), \ldots, f\left(x_{N}\right)\right\|_{Y}-\right\| x_{1}, \ldots, x_{N} \|_{X} \mid \leq \varphi(x_{1}, \ldots, x_{N}, \underbrace{0, \ldots, 0}_{m n-\text { N times }}) \tag{2.22}
\end{gather*}
$$

for all $x_{1}, \ldots, x_{m n} \in X$. Then there exists a unique additive $N$-isometry $U: X \rightarrow Y$ such that

$$
\begin{align*}
& \|f(x)-U(x)\| \\
& \leq \frac{1}{2 m s_{m n-2} C_{k-1}} \tilde{\varphi}(\underbrace{0, \ldots, 0}_{m-2 q \text { times }}, \underbrace{\frac{m x}{q}, \ldots, \frac{m x}{q}}_{q \text { times }}, \underbrace{0, \ldots, 0}_{q \text { times }}, \underbrace{\frac{m x}{q}, \ldots, \frac{m x}{q}}_{q \text { times }}, \underbrace{0, \ldots, 0}_{m-q \text { times }}, \ldots, \\
& \underbrace{0, \ldots, 0}_{m-2 q \text { times }}, \underbrace{\frac{m x}{q}, \ldots, \frac{m x}{q}}_{q \text { times }}, \underbrace{0, \ldots, 0}_{q \text { times }}, \underbrace{\frac{m x}{q}, \ldots, \frac{m x}{q}}_{q \text { times }}, \underbrace{0, \ldots, 0}_{m-q \text { times }}, \underbrace{0, \ldots, 0}_{m-2 m s t i m e s}) \\
& +\frac{1}{2 m s_{m n-2} C_{k-1}} \tilde{\varphi}(\underbrace{0, \ldots, 0}_{m-2 q \text { times }}, \underbrace{\frac{m x}{q}, \ldots, \frac{m x}{q}}_{q \text { times }}, \underbrace{\frac{m x}{q}, \ldots, \frac{m x}{q}}_{q \text { times }}, \underbrace{0, \ldots, 0}_{q \text { times }}, \underbrace{0, \ldots, 0}_{m-q \text { times }}, \ldots, \\
& \underbrace{0, \ldots, 0}_{m-2 q \text { times }}, \underbrace{\frac{m x}{q}, \ldots, \frac{m x}{q}}_{q \text { times }}, \underbrace{\frac{m x}{q}, \ldots, \frac{m x}{q}}_{q \text { times }}, \underbrace{0, \ldots, 0}_{q \text { times }}, \underbrace{0, \ldots, 0}_{m-q \text { times }}, \underbrace{0, \ldots, 0}_{m-2 m s t i m e s}) \tag{2.23}
\end{align*}
$$

for all $x \in X$.

Proof. From [17, Theorem 3.1], it follows from (2.20) and (2.21) that there exists a unique additive mapping $U: X \rightarrow Y$ satisfying (2.23). The additive mapping $U: X \rightarrow Y$ is given by

$$
\begin{equation*}
U(x)=\lim _{d \rightarrow \infty} \frac{1}{2^{d}} f\left(2^{d} x\right) \tag{2.24}
\end{equation*}
$$

for all $x \in X$.
It follows from (2.22) that

$$
\begin{align*}
& \left|\left|\left|\frac{1}{2^{d}} f\left(2^{d} x_{1}\right), \ldots, \frac{1}{2^{d}} f\left(2^{d} x_{N}\right)\left\|_{Y}-\right\| x_{1}, \ldots, x_{N} \|_{X}\right|\right.\right. \\
& \quad=\frac{1}{2^{d N}}| |\left|f\left(2^{d} x_{1}\right), \ldots, f\left(2^{d} x_{N}\right)\left\|_{Y}-\right\| 2^{d} x_{1}, \ldots, 2^{d} x_{N} \|_{X}\right| \\
& \quad \leq \frac{1}{2^{d N}} \varphi(2^{d} x_{1}, \ldots, 2^{d} x_{N}, \underbrace{0, \ldots, 0}_{m n-N \text { times }})  \tag{2.25}\\
& \quad \leq \frac{1}{2^{d}} \varphi(2^{d} x_{1}, \ldots, 2^{d} x_{N}, \underbrace{0, \ldots, 0}_{m n-N \text { times }}),
\end{align*}
$$

which tends to zero for all $x_{1}, \ldots, x_{N} \in X$ by (2.20). By (2.24),

$$
\begin{equation*}
\left\|U\left(x_{1}\right), \ldots, U\left(x_{N}\right)\right\|_{Y}=\lim _{d \rightarrow \infty}\left\|\frac{1}{2^{d}} f\left(2^{d} x_{1}\right), \ldots, \frac{1}{2^{d}} f\left(2^{d} x_{N}\right)\right\|_{Y}=\left\|x_{1}, \ldots, x_{N}\right\|_{X} \tag{2.26}
\end{equation*}
$$

for all $x_{1}, \ldots, x_{N} \in X$. Since $U: X \rightarrow Y$ is additive,

$$
\begin{align*}
& \left\|U\left(x_{1}\right)-U\left(y_{1}\right), \ldots, U\left(x_{N}\right)-U\left(y_{N}\right)\right\|_{Y} \\
& \quad=\left\|U\left(x_{1}-y_{1}\right), \ldots, U\left(x_{N}-y_{N}\right)\right\|_{Y}=\left\|x_{1}-y_{1}, \ldots, x_{N}-y_{N}\right\|_{X} \tag{2.27}
\end{align*}
$$

for all $x_{1}, y_{1}, \ldots, x_{N}, y_{N} \in X$. So the additive mapping $U: X \rightarrow Y$ is an $N$-isometry, as desired.

Corollary 2.7. Let $f: X \rightarrow Y$ be a mapping with $f(0)=0$ for which there exist constants $\theta \geq 0$ and $p \in[0,1)$ such that

$$
\begin{gather*}
\| m n_{m n-2} C_{k-2} f\left(\frac{x_{1}+\cdots+x_{m n}}{m n}\right)+m_{m n-2} C_{k-1} \sum_{i=1}^{n} f\left(\frac{x_{m i-m+1}+\cdots+x_{m i}}{m}\right) \\
-k \sum_{1 \leq i_{1}<\cdots<i_{k} \leq m n} f\left(\frac{x_{i_{1}}+\cdots+x_{i_{k}}}{k}\right)\left\|\leq \theta \sum_{j=1}^{m n}\right\| x_{j} \|^{p},  \tag{2.28}\\
\left|\left\|f\left(x_{1}\right), \ldots, f\left(x_{N}\right)\right\|_{Y}-\left\|x_{1}, \ldots, x_{N}\right\|_{X}\right| \leq \theta \sum_{j=1}^{N}\left\|x_{j}\right\|^{p}
\end{gather*}
$$

for all $x_{1}, \ldots, x_{m n} \in X$. Then there exists a unique additive $N$-isometry $U: X \rightarrow Y$ such that

$$
\begin{equation*}
\|f(x)-U(x)\| \leq \frac{4 m^{p-1} q^{1-p} \theta}{\left(2-2^{p}\right)_{m n-2} C_{k-1}}\|x\|^{p} \tag{2.29}
\end{equation*}
$$

for all $x \in X$.
Proof. Define $\varphi\left(x_{1}, \ldots, x_{m n}\right)=\theta \sum_{j=1}^{m n}\left\|x_{j}\right\|^{p}$, and apply Theorem 2.6.
Theorem 2.8. Let $f: X \rightarrow Y$ be a mapping with $f(0)=0$ for which there exists a function $\varphi: X^{m n} \rightarrow[0, \infty)$ satisfying (2.21) and (2.22) such that

$$
\begin{equation*}
\sum_{j=1}^{\infty} 2^{j N} \varphi\left(\frac{x_{1}}{2^{j}}, \ldots, \frac{x_{m n}}{2^{j}}\right)<\infty \tag{2.30}
\end{equation*}
$$

for all $x_{1}, \ldots, x_{m n} \in X$. Then there exists a unique additive $N$-isometry $U: X \rightarrow Y$ such that

$$
\begin{align*}
& \|f(x)-U(x)\| \\
& \leq \frac{1}{2 m s_{m n-2} C_{k-1}} \tilde{\varphi}(\underbrace{0, \ldots, 0}_{m-2 q \text { times }}, \underbrace{\frac{m x}{q}, \ldots, \frac{m x}{q}}_{q \text { times }}, \underbrace{0, \ldots, 0}_{q \text { times }}, \underbrace{\frac{m x}{q}, \ldots, \frac{m x}{q}}_{q \text { times }}, \underbrace{0, \ldots, 0}_{m-q \text { times }}, \ldots, \\
& \underbrace{0, \ldots, 0}_{m-2 q \text { times }}, \underbrace{\frac{m x}{q}, \ldots, \frac{m x}{q}}_{q \text { times }}, \underbrace{0, \ldots, 0}_{q \text { times }}, \underbrace{\frac{m x}{q}, \ldots, \frac{m x}{q}}_{q \text { times }}, \underbrace{0, \ldots, 0}_{m-q \text { times }}, \underbrace{0, \ldots, 0}_{m n-2 m s t i m e s}) \\
& +\frac{1}{2 m s_{m n-2} C_{k-1}} \tilde{\varphi}(\underbrace{0, \ldots, 0}_{m-2 q \text { times }}, \underbrace{\frac{m x}{q}, \ldots, \frac{m x}{q}}_{q \text { times }}, \underbrace{\frac{m x}{q}, \ldots, \frac{m x}{q}}_{q \text { times }}, \underbrace{0, \ldots, 0}_{q \text { times }}, \underbrace{0, \ldots, 0}_{m-q \text { times }}, \ldots, \\
& \underbrace{0, \ldots, 0}_{m-2 q \text { times }}, \underbrace{\frac{m x}{q}, \ldots, \frac{m x}{q}}_{q \text { times }}, \underbrace{\frac{m x}{q}, \ldots, \frac{m x}{q}}_{q \text { times }}, \underbrace{0, \ldots, 0}_{q \text { times }}, \underbrace{0, \ldots, 0}_{m-q \text { times }}, \underbrace{0, \ldots, 0}_{m-2 m s t \text { times }} \tag{2.31}
\end{align*}
$$

for all $x \in X$, where

$$
\begin{equation*}
\tilde{\varphi}\left(x_{1}, \ldots, x_{m n}\right):=\sum_{j=1}^{\infty} 2^{j} \varphi\left(\frac{x_{1}}{2^{j}}, \ldots, \frac{x_{m n}}{2^{j}}\right) \tag{2.32}
\end{equation*}
$$

for all $x_{1}, \ldots, x_{m n} \in X$.

Proof. Note that

$$
\begin{equation*}
2^{j} \varphi\left(\frac{x_{1}}{2^{j}}, \ldots, \frac{x_{m n}}{2^{j}}\right) \leq 2^{j N} \varphi\left(\frac{x_{1}}{2^{j}}, \ldots, \frac{x_{m n}}{2^{j}}\right) \tag{2.33}
\end{equation*}
$$

for all $x_{1}, \ldots, x_{N} \in X$ and all positive integers $j$. From [17, Theorem 3.3], it follows from (2.21), (2.30), and (2.33) that there exists a unique additive mapping $U: X \rightarrow Y$ satisfying (2.31). The additive mapping $U: X \rightarrow Y$ is given by

$$
\begin{equation*}
U(x)=\lim _{d \rightarrow \infty} 2^{d} f\left(\frac{x}{2^{d}}\right) \tag{2.34}
\end{equation*}
$$

for all $x \in X$.
It follows from (2.22) that

$$
\begin{align*}
& \left.\left\|\left.\right|^{2^{l}} f\left(\frac{x_{1}}{2^{l}}\right), \ldots, 2^{l} f\left(\frac{x_{N}}{2^{l}}\right)\right\|_{Y}-\left\|x_{1}, \ldots, x_{N}\right\|_{X} \right\rvert\, \\
& \quad=2^{l N}\left|\left\|f\left(\frac{x_{1}}{2^{l}}\right), \ldots, f\left(\frac{x_{N}}{2^{l}}\right)\right\|_{Y}-\left\|\frac{x_{1}}{2^{l}}, \ldots, \frac{x_{N}}{2^{l}}\right\|_{X}\right|  \tag{2.35}\\
& \quad \leq 2^{l N} \varphi(\frac{x_{1}}{2^{l}}, \ldots, \frac{x_{N}}{2^{l}}, \underbrace{0, \ldots, 0}_{m n-N \text { times }}),
\end{align*}
$$

which tends to zero $l \rightarrow \infty$ for all $x_{1}, \ldots, x_{N} \in X$ by (2.30). By (2.34),

$$
\begin{equation*}
\left\|U\left(x_{1}\right), \ldots, U\left(x_{N}\right)\right\|_{Y}=\lim _{l \rightarrow \infty}\left\|2^{l} f\left(\frac{x_{1}}{2^{l}}\right), \ldots, 2^{l} f\left(\frac{x_{N}}{2^{l}}\right)\right\|_{Y}=\left\|x_{1}, \ldots, x_{N}\right\|_{X} \tag{2.36}
\end{equation*}
$$

for all $x_{1}, \ldots, x_{N} \in X$. Since $U: X \rightarrow Y$ is additive,

$$
\begin{align*}
& \left\|U\left(x_{1}\right)-U\left(y_{1}\right), \ldots, U\left(x_{N}\right)-U\left(y_{N}\right)\right\|_{Y} \\
& \quad=\left\|U\left(x_{1}-y_{1}\right), \ldots, U\left(x_{N}-y_{N}\right)\right\|_{Y}=\left\|x_{1}-y_{1}, \ldots, x_{N}-y_{N}\right\|_{X} \tag{2.37}
\end{align*}
$$

for all $x_{1}, y_{1}, \ldots, x_{N}, y_{N} \in X$. So the additive mapping $U: X \rightarrow Y$ is an $N$-isometry, as desired.

Corollary 2.9. Let $f: X \rightarrow Y$ be a mapping with $f(0)=0$ for which there exist constants $\theta \geq 0$ and $p \in(N, \infty)$ satisfying (2.28). Then there exists a unique additive $N$-isometry $U: X \rightarrow Y$ such that

$$
\begin{equation*}
\|f(x)-U(x)\| \leq \frac{4 m^{p-1} q^{1-p} \theta}{\left(2^{p}-2\right)_{m n-2} C_{k-1}}\|x\|^{p} p \tag{2.38}
\end{equation*}
$$

for all $x \in X$.
Proof. Define $\varphi\left(x_{1}, \ldots, x_{m n}\right)=\theta \sum_{j=1}^{m n}\left\|x_{j}\right\|^{p}$, and apply Theorem 2.8.
Similarly, we can prove the corresponding results for the case $N>m n$.
