Communicated by Jan J. Sławianowski

Abstract. This work is a review of our research activity during the last ten years concerning the problems of modeling and control of multi-body mechanical systems. Because the treatment of the above topics is quite sensitive with respect to the different parameterizations of the rotation group in three dimensional space $SO(3)$ and because the properties of the parameterization more or less influence the efficiency of the dynamic model, here the so called vector-parameter is used for parallel considerations. The consideration of the mechanical system in the configurational space of pure vector-parameters with a group structure opens the possibilities for the Lie group theory to be applied in the problems of the dynamics and control. The sections in this paper present independent parts of an unified scientific approach.

Contents

1. Introduction in Multi-Body Mechanical System	19
2. Rigid Body Kinematics	23
2.1. Vector Kinematics	24
2.2. Quaternions and Quaternion Kinematics	26
2.3. Spinors and Spinor Kinematics	28
2.4. Vector-Parameter Representations of Rotations	33
2.5. Vector-Parameters for Different $SO(3)$ Parameterizations	35
2.6. Euclidean Motion	36
2.7. Dynamics and Control of a Rigid Body with Vector-Parameters	40
3. Kinematics and Dynamics of a Manipulator System with Vector-Parameters	42
3.1. Basic Kinematical Relations	42
3.2. Dynamics in Q_{ct}	45
4. Screw Considerations	47
4.1. Screw Kinematics of a Rigid Body	48
4.2. Dual Vector-Parameter in Manipulator Kinematics	49
4.2.1. Manipulator Skeleton and Line Geometry	49
4.2.2. Dual Orthogonal Matrices and Dual Vector-Parameters	51
