journal of inequalities in pure and applied mathematics

1. Introduction

Let A_p be the class of functions of the form

(1.1)
$$f(z) = z^p + \sum_{k=1}^{\infty} a_{p+k} z^{p+k}$$

which are analytic in the open unit disk $E = \{z \in \mathbb{C} : |z| < 1\}$. A function $f \in A_p$ is said to be *p*-valently starlike of order α of it satisfies the condition

$$\operatorname{Re}\left\{\frac{zf'(z)}{f(z)}\right\} > \alpha \quad (0 \le \alpha < p, z \in E).$$

We denote by $S_p^*(\alpha)$.

On the other hand, a function $f \in A_p$ is said to be *p*-valently close-to-convex functions of order α if it satisfies the condition

$$\operatorname{Re}\left\{\frac{zf'(z)}{g(z)}\right\} > \alpha \quad (0 \le \alpha < p, z \in E),$$

for some starlike function g(z). We denote by $C_p(\alpha)$.

For $f \in A_p$ given by (1.1), the generalized Bernardi integral operator F_c is defined by

(1.2)
$$F_{c}(z) = \frac{c+p}{z^{c}} \int_{0}^{z} f(t)t^{c-1}dt$$
$$= z^{p} + \sum_{k=1}^{\infty} \frac{c+p}{c+p+k} a_{p+k} z^{p+k} \quad (c+p>0, \ z \in E).$$

journal of inequalities in pure and applied mathematics

For an analytic function g, defined in E by

$$g(z) = z^p + \sum_{k=1}^{\infty} b_{p+k} z^{p+k},$$

Flett [3] defined the multiplier transform I^{η} for a real number η by

$$I^{\eta}g(z) = \sum_{k=0}^{\infty} (p+k+1)^{-\eta} b_{p+k} z^{p+k} \quad (z \in E)$$

Clearly, the function $I^{\eta}g$ is analytic in E and

$$I^\eta(I^\mu g(z)) = I^{\eta+\mu}g(z)$$

for all real numbers η and μ .

For any integer n, J. Patel and P. Sahoo [5] also defined the operator D^n , for an analytic function f given by (1.1), by

1.3)
$$D^{n}f(z) = z^{p} + \sum_{k=1}^{\infty} \left(\frac{p+k+1}{1+p}\right)^{-n} a_{p+k} z^{p+k}$$
$$= f(z) * z^{p-1} \left[z + \sum_{k=1}^{\infty} \left(\frac{k+1+p}{1+p}\right)^{-n} z^{k+1} \right] \quad (z \in E),$$

where * stands for the Hadamard product or convolution.

It follows from (1.3) that

(1.4)
$$z(D^n f(z))^{n-1} f(z) - D^n f(z).$$

We also have

$$D^0 f(z) = f(z)$$
 and $D^{-1} f(z) = \frac{zf'(z) + f(z)}{p+1}$.

journal of inequalities in pure and applied mathematics

If f and g are analytic functions in E, then we say that f is subordinate to g, written f < g or f(z) < g(z), if there is a function w analytic in E, with w(0) = 0, |w(z)| < 1 for $z \in E$, such that f(z) = g(w(z)), for $z \in U$. If g is univalent then f < g if and only if f(0) = g(0) and $f(E) \subset g(E)$.

Making use of the operator notation D^n , we introduce a subclass of A_p as follows:

Definition 1.1. For any integer n and $-1 \le B < A \le 1$, a function $f \in A_p$ is said to be in the class $K_{n,p}(A, B)$ if

(1.5)
$$\frac{z(D^n f(z))'}{z^p} < \frac{p(1+Az)}{1+Bz},$$

where < denotes subordination.

For convenience, we write

$$K_{n,p}\left(1-\frac{2\alpha}{p},-1\right)=K_{n,p}(\alpha)$$

where $K_{n,p}(\alpha)$ denote the class of functions $f \in A_p$ satisfying the inequality

$$\operatorname{Re}\left\{\frac{z(D^n f(z))'}{z^p}\right\} > \alpha \quad (0 \le \alpha < p, \ z \in E)$$

We also note that $K_{0,p}(\alpha) \equiv C_p(\alpha)$ is the class of *p*-valently close-to-convex functions of order α .

In this present paper, we derive some properties of a certain class $K_{n,p}(A, B)$ by using differential subordination.

journal of inequalities in pure and applied mathematics

2. Preliminaries and Main Results

In our present investigation of the general class $K_{n,p}(A, B)$, we shall require the following lemmas.

Lemma 2.1 ([4]). If the function $p(z) = 1 + c_1 z + c_2 z^2 + \cdots$ is analytic in E, h(z) is convex in E with h(0) = 1, and γ is complex number such that $\operatorname{Re} \gamma > 0$. Then the Briot-Bouquet differential subordination

 $p(z) + \frac{zp'(z)}{\gamma} < h(z)$

implies

$$p(z) < q(z) = \frac{\gamma}{z^{\gamma}} \int_0^z t^{\gamma - 1} h(t) dt < h(z) \quad (z \in E)$$

and q(z) is the best dominant.

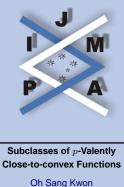

For complex numbers a, b and $c \neq 0, -1, -2, \ldots$, the hypergeometric series

(2.1)
$$_{2}F_{1}(a,b;c;z) = 1 + \frac{ab}{c}z + \frac{a(a+1)b(b+1)}{2!c(c+1)}z^{2} + \cdots$$

represents an analytic function in E. It is well known by [1] that

Lemma 2.2. Let *a*, *b* and *c* be real $c \neq 0, -1, -2, ...$ and c > b > 0. Then

(2.2)
$$\int_{0}^{1} t^{b-1} (1-t)^{c-b-1} (1-tz)^{-a} dt = \frac{\Gamma(b)\Gamma(c-b)}{\Gamma(c)} {}_{2}F_{1}(a,b;c;z),$$
$${}_{2}F_{1}(a,b;c;z) = (1-z)^{-a} {}_{2}F_{1}\left(a,c-b;c;\frac{z}{z-1}\right)$$

journal of inequalities in pure and applied mathematics

and

(2.3)
$${}_{2}F_{1}(a,b;c;z) = {}_{2}F_{1}(b,a;c;z).$$

Lemma 2.3 ([6]). Let $\phi(z)$ be convex and g(z) is starlike in E. Then for F analytic in E with F(0) = 1, $\frac{\phi * Fg}{\phi * q}(E)$ is contained in the convex hull of F(E).

Lemma 2.4 ([2]). Let $\phi(z) = 1 + \sum_{k=1}^{\infty} c_k z^k$ and $\phi(z) < \frac{1+Az}{1+Bz}$. Then $|c_k| \le (A - B)$.

Theorem 2.5. Let n be any integer and $-1 \leq B < A \leq 1$. If $f \in K_{n,p}(A, B)$, then

(2.4)
$$\frac{z(D^{n+1}f(z))'}{z^p} < q(z) < \frac{p(1+Az)}{1+Bz} \quad (z \in E),$$

where

(2.5)
$$q(z) = \begin{cases} {}_{2}F_{1}(1, p+1; p+2; -Bz) \\ +\frac{p+1}{p+2}Az_{2}F_{1}(1, p+2; p+3; -Bz), & B \neq 0; \\ 1 + \frac{p+1}{p+2}Az, & B = 0, \end{cases}$$

and q(z) is the best dominant of (2.4). Furthermore, $f \in K_{n+1,p}(\rho(p, A, B))$, where

(2.6)
$$\rho(p, A, B) = \begin{cases} p_2 F_1(1, p+1; p+2; B) \\ -\frac{p(p+1)}{p+2} A_2 F_1(1, p+2; p+3; B), & B \neq 0; \\ 1 - \frac{p+1}{p+2} A, & B = 0. \end{cases}$$

journal of inequalities in pure and applied mathematics

Proof. Let

(2.7)
$$p(z) = \frac{z(D^{n+1}f(z))'}{pz^p},$$

where p(z) is analytic function with p(0) = 1.

Using the identity (1.4) in (2.7) and differentiating the resulting equation, we get

(2.8)
$$\frac{z(D^n f(z))'}{pz^p} = p(z) + \frac{zp'(z)}{p+1} < \frac{1+Az}{1+Bz} (\equiv h(z)).$$

Thus, by using Lemma 2.1 (for $\gamma = p + 1$), we deduce that

$$p(z) < (p+1)z^{-(p+1)} \int_0^z \frac{t^p(1+At)}{1+Bt} dt (\equiv q(z))$$

= $(p+1) \int_0^1 \frac{s^p(1+Asz)}{1+Bsz} ds$
(2.9) = $(p+1) \int_0^1 \frac{s^p}{1+Bsz} ds + (p+1)Az \int_0^1 \frac{s^{p+1}}{1+Bsz} ds.$

By using (2.2) in (2.9), we obtain

$$p(z) < q(z) = \begin{cases} {}_{2}F_{1}(1, p+1; p+2; -Bz) \\ +\frac{p+1}{p+2}Az_{2}F_{1}(1, p+2; p+3; -Bz), & B \neq 0; \\ 1 + \frac{p+1}{p+2}Az, & B = 0. \end{cases}$$

Thus, this proves (2.5).

Now, we show that

(2.10) $\operatorname{Re} q(z) \ge q(-r) \quad (|z| = r < 1).$

journal of inequalities in pure and applied mathematics

Since $-1 \le B < A \le 1$, the function (1 + Az)/(1 + Bz) is convex(univalent) in E and

$$\operatorname{Re}\left(\frac{1+Az}{1+Bz}\right) \ge \frac{1-Ar}{1-Br} > 0 \quad (|z|=r<1).$$

Setting

$$g(s.z) = \frac{1 + Asz}{1 + Bsz} \quad (0 \le s \le 1, \quad z \in E)$$

and $d\mu(s) = (p+1)s^p ds$, which is a positive measure on [0, 1], we obtain from (2.9) that

$$q(z) = \int_0^1 g(s, z) d\mu(s) \quad (z \in E).$$

Therefore, we have

$$\operatorname{Re} q(z) = \int_0^1 \operatorname{Re} g(s, z) d\mu(s) \ge \int_0^1 \frac{1 - Asr}{1 - Bsr} d\mu(s)$$

which proves the inequality (2.10).

Now, using (2.10) in (2.9) and letting $r \to 1^-$, we obtain

$$\operatorname{Re}\left\{\frac{z(D^{n+1}f(z))'}{z^p}\right\} > \rho(p, A, B),$$

where

$$\rho(p, A, B) = \begin{cases} p_2 F_1(1, p+1; p+2; B) \\ -\frac{p(p+1)}{p+2} A_2 F_1(1, p+2; p+3; B), & B \neq 0 \\ p - \frac{p(p+1)}{p+2} A, & B = 0. \end{cases}$$

journal of inequalities in pure and applied mathematics

This proves the assertion of Theorem 2.5. The result is best possible because of the best dominant property of q(z).

Putting $A = 1 - \frac{2\alpha}{p}$ and B = -1 in Theorem 2.5, we have the following:

Corollary 2.6. For any integer n and $0 \le \alpha < p$, we have

$$K_{n,p}(\alpha) \subset K_{n+1,p}(\rho(p,\alpha)),$$

where

(2.11)
$$\rho(p,\alpha) = p \cdot {}_2F_1(1,p+1;p+2;-1) \\ - \frac{p(p+1)}{p+2}(1-2\alpha){}_2F_1(1,p+2;p+3;-1).$$

The result is best possible.

Taking p = 1 in Corollary 2.6, we have the following:

Corollary 2.7. For any integer n and $0 \le \alpha < 1$, we have

$$K_n(\delta) \subset K_{n+1}(\delta(\alpha)),$$

where

(2.12)
$$\delta(\alpha) = 1 + 4(1 - 2\alpha) \sum_{k=1}^{\infty} \frac{1}{k+2} (-1)^k.$$

Theorem 2.8. For any integer n and $0 \le \alpha < p$, if $f(z) \in K_{n+1,p}(\alpha)$, then $f \in K_{n,p}(\alpha)$ for |z| < R(p), where $R(p) = \frac{-1+\sqrt{1+(p+1)^2}}{p+1}$. The result is best possible.

journal of inequalities in pure and applied mathematics

Proof. Since $f(z) \in K_{n+1,p}(\alpha)$, we have

(2.13)
$$\frac{z(D^{n+1}f(z))'}{z^p} = \alpha + (p-\alpha)w(z), \quad (0 \le \alpha < p),$$

where $w(z) = 1 + w_1 z + w_2 z + \cdots$ is analytic and has a positive real part in *E*. Making use of logarithmic differentiation and using identity (1.4) in (2.13), we get

(2.14)
$$\frac{z(D^n f(z))'}{z^p} - \alpha = (p - \alpha) \left[w(z) + \frac{zw'(z)}{p+1} \right].$$

Now, using the well-known (by [5])

$$\frac{|zw'(z)|}{\operatorname{Re} w(z)} \leq \frac{2r}{1-r^2} \quad \text{and} \quad \operatorname{Re} w(z) \geq \frac{1-r}{1+r} \quad (|z|=r<1),$$

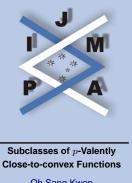

in (2.14), we get

$$\operatorname{Re}\left\{\frac{z(D^{n}f(z))'}{z^{p}} - \alpha\right\} = (p - \alpha)\operatorname{Re}w(z)\left\{1 + \frac{1}{p+1}\frac{\operatorname{Re}zw'(z)}{\operatorname{Re}w(z)}\right\}$$
$$\geq (p - \alpha)\operatorname{Re}w(z)\left\{1 - \frac{1}{p+1}\frac{|zw'(z)|}{\operatorname{Re}w(z)}\right\}$$
$$\geq (p - \alpha)\frac{1 - r}{1 + r}\left\{1 - \frac{1}{p+1}\frac{2r}{1 - r^{2}}\right\}.$$

It is easily seen that the right-hand side of the above expression is positive if $|z| < R(p) = \frac{-1+\sqrt{1+(p+1)^2}}{p+1}$. Hence $f \in K_{n,p}(\alpha)$ for |z| < R(p).

To show that the bound R(p) is best possible, we consider the function $f \in A_p$ defined by

$$\frac{z(D^{n+1}f(z))'}{z^p} = \alpha + (p-\alpha)\frac{1-z}{1+z} \quad (z \in E)$$

journal of inequalities in pure and applied mathematics

Noting that

$$\frac{z(D^n f(z))'}{z^p} - \alpha = (p - \alpha) \cdot \frac{1 - z}{1 + z} \left\{ 1 + \frac{1}{p + 1} \frac{-2z}{(p + 1)(1 - z^2)} \right\}$$
$$= (p - \alpha) \cdot \frac{1 - z}{1 + z} \left\{ \frac{(p + 1) - (p + 1)z^2 - 2z}{(p + 1) - (p + 1)z^2} \right\}$$
$$= 0$$

for $z = \frac{-1+\sqrt{1+(p+1)^2}}{p+1}$, we complete the proof of Theorem 2.8. Putting n = -1, p = 1 and $0 \le \alpha < 1$ in Theorem 2.8, we have the following: **Corollary 2.9.** If $\operatorname{Re} f'(z) > \alpha$, then $\operatorname{Re}\{zf''(z) + 2f'(z)\} > \alpha$ for $|z| < \frac{-1+\sqrt{5}}{2}$. Theorem 2.10.

(a) If $f \in K_{n,p}(A, B)$, then the function F_c defined by (1.2) belongs to $K_{n,p}(A, B)$. (b) $f \in K_{n,p}(A, B)$ implies that $F_c \in K_{n,p}(\eta(p, c, A, B))$ where

$$\eta(p,c,A,B) = \begin{cases} p_2 F_1(1,p+c;p+c+1;B) \\ -\frac{p(p+c)}{p+c+1} A_2 F_1(1,p+c+1;p+c+2;B), & B \neq 0 \\ p - \frac{p(p+c)}{p+c+1} A, & B = 0. \end{cases}$$

Proof. Let

(2.15)
$$\phi(z) = \frac{z(D^n F_c(z))'}{p z^p},$$

journal of inequalities in pure and applied mathematics

where $\phi(z)$ is an analytic function with $\phi(0) = 1$. Using the identity

(2.16)
$$z(D^n F_c(z))^{\prime n} f(z) - c D^n F_c(z)$$

in (2.15) and differentiating the resulting equation, we get

$$\frac{z(D^n f(z))'}{pz^p} = \phi(z) + \frac{z\phi'(z)}{p+c}.$$

Since $f \in K_{n,p}(A, B)$,

$$\phi(z) + \frac{z\phi'(z)}{p+c} < \frac{1+Az}{1+Bz}.$$

By Lemma 2.1, we obtain $F_c(z) \in K_{n,p}(A, B)$. We deduce that

(2.17)
$$\phi(z) < q(z) < \frac{1+Az}{1+Bz},$$

where q(z) is given by (2.5) and is the best dominant of (2.17).

This proves part (a) of the theorem. Proceeding as in Theorem 2.10, part (b) follows. $\hfill \Box$

Putting $A = 1 - \frac{2\alpha}{n}$ and B = -1 in Theorem 2.8, we have the following:

Corollary 2.11. If $f \in K_{n,p}(A, B)$ for $0 \le \alpha < p$, then $F_c \in K_{n,p}\mathcal{H}(p, c, \alpha)$, where

$$\mathcal{H}(p,c,\alpha) = p \cdot {}_{2}F_{1}(1, p+c; p+c+1; -1) - \frac{p+c}{p+c+1}(p-2\alpha){}_{2}F_{1}(1, p+c; p+c+1; -1).$$

Setting c = p = 1 in Theorem 2.10, we get the following result.

in pure and applied mathematics

Corollary 2.12. If $f \in K_{n,p}(\alpha)$ for $0 \le \alpha < 1$, then the function

$$G(z) = \frac{2}{z} \int_0^z f(t) dt$$

belongs to the class $K_n(\delta(\alpha))$, where $\delta(\alpha)$ is given by (2.12).

Theorem 2.13. For any integer n and $0 \le \alpha < p$ and c > -p, if $F_c \in K_{n,p}(\alpha)$ then the function f defined by (1.1) belongs to $K_{n,p}(\alpha)$ for $|z| < R(p,c) = \frac{-1+\sqrt{1+(p+c)^2}}{p+c}$. The result is best possible.

Proof. Since $F_c \in K_{n,p}(\alpha)$, we write

(2.18)
$$\frac{z(D^n F_c)'}{z^p} = \alpha + (p - \alpha)w(z),$$

where w(z) is analytic, w(0) = 1 and $\operatorname{Re} w(z) > 0$ in E. Using (2.16) in (2.18) and differentiating the resulting equation, we obtain

(2.19)
$$\operatorname{Re}\left\{\frac{z(D^n f(z))'}{z^p} - \alpha\right\} = (p - \alpha) \operatorname{Re}\left\{w(z) + \frac{zw'(z)}{p+c}\right\}.$$

Now, by following the line of proof of Theorem 2.8, we get the assertion of Theorem 2.13. $\hfill \Box$

Theorem 2.14. Let $f \in K_{n,p}(A, B)$ and $\phi(z) \in A_p$ convex in E. Then

$$(f * \phi(z))(z) \in K_{n,p}(A, B).$$

Proof. Since $f(z) \in K_{n,p}(A, B)$,

$$\frac{z(D^n f(z))'}{pz^p} < \frac{1+Az}{1+Bz},$$

journal of inequalities in pure and applied mathematics

Now

(2.20)
$$\frac{z(D^{n}(f*\phi)(z))'}{pz^{p}*\phi(z)} = \frac{\phi(z)*z(D^{n}f)'}{\phi(z)*pz^{p}} = \frac{\phi(z)*\frac{z(D^{n}f(z))'}{pz^{p}}pz^{p}}{\phi(z)*pz^{p}}.$$

Then applying Lemma 2.3, we deduce that

$$\frac{\phi(z) * \frac{z(D^n f(z))'}{pz^p} p z^p}{\phi(z) * p z^p} < \frac{1 + Az}{1 + Bz}$$

Hence
$$(f * \phi(z))(z) \in K_{n,p}(A, B)$$
.

Theorem 2.15. Let a function f(z) defined by (1.1) be in the class $K_{n,p}(A, B)$. Then

(2.21)
$$|a_{p+k}| \le \frac{p(A-B)(p+k+1)^n}{(1+p)^n(p+k)}$$
 for $k = 1, 2, \dots$

The result is sharp.

Proof. Since $f(z) \in K_{n,p}(A, B)$, we have

$$\frac{z(D^n f(z))'}{pz^p} \equiv \phi(z) \quad \text{and} \quad \phi(z) < \frac{1+Az}{1+Bz}$$

Hence

(2.22)
$$z(D^n f(z))'^p \phi(z)$$
 and $\phi(z) = 1 + \sum_{k=1}^{\infty} c_k z^k$.

◀ Page 15 of 18 Go Back Full Screen Close journal of inequalities

in pure and applied mathematics

From (2.22), we have

$$z(D^{n}f(z))' = z\left(z^{p} + \sum_{k=1}^{\infty} \left(\frac{1+p}{p+k+1}\right)^{n} a_{p+k} z^{p+k}\right)'$$
$$= pz^{p} + \sum_{k=1}^{\infty} \left(\frac{1+p}{p+k+1}\right)^{n} (p+k) a_{p+k} z^{p+k}$$
$$= pz^{p} \left(1 + \sum_{k=1}^{\infty} c_{k} z^{k}\right).$$

Therefore

(2.23)
$$\left(\frac{1+p}{p+k+1}\right)^n (p+k)a_{p+k} = pc_k.$$

By using Lemma 2.4 in (2.23),

$$\frac{\left(\frac{1+p}{p+k+1}\right)^n (p+k)|a_{p+k}|}{p} = |c_k| \le A - B.$$

Hence

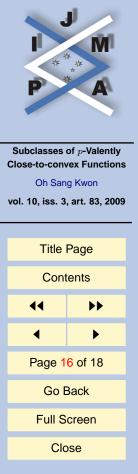

$$a_{p+k}| \le \frac{p(A-B)(p+k+1)^n}{(1+p)^n(p+k)}.$$

The equality sign in (2.21) holds for the function f given by

(2.24)
$$(D^n f(z))' = \frac{pz^{p-1} + p(A - B - 1)z^p}{1 - z}.$$

Hence

$$\frac{z(D^n f(z))'}{pz^p} = \frac{1 + (A - B - 1)z}{1 - z} < \frac{1 + Az}{1 + Bz} \quad \text{for } k = 1, 2, \dots$$

journal of inequalities in pure and applied mathematics

The function f(z) defined in (2.24) has the power series representation in E,

$$f(z) = z^{p} + \sum_{k=1}^{\infty} \frac{p(A-B)(p+k+1)^{n}}{(1+p)^{n}(p+k)} z^{p+k}.$$
