Abstract

In this article, we give the monotonicity and concavity properties of some functions involving the gamma function and some equivalence sequences to the sequence n! with exact equivalence constants.

Monotonicity and Concavity Properties of Some Functions Involving the Gamma Function with Applications

J. Ineq. Pure and Appl. Math. 7(2) Art. 45, 2006 http://jipam.vu.edu.au

1. Introduction and Main Results

Throughout the paper, let \mathbb{N} denote the set of all positive integers and $\mathbb{N}_0 = \mathbb{N} \cup \{0\}$.

We say $a_n \simeq b_n$ $(n \ge n_0)$ if there exist two constants $c_1 > 0$ and $c_2 > 0$ such that

$$(1.1) c_1 b_n \le a_n \le c_2 b_n$$

hold for all $n \ge n_0$. The fixed numbers c_1 and c_2 in (1.1) are called equivalence constants.

The incomplete gamma function is defined for $\operatorname{Re} z > 0$ by

(1.2)
$$\Gamma(z,x) = \int_x^\infty t^{z-1} e^{-t} \, \mathrm{d}t, \quad \gamma(z,x) = \int_0^x t^{z-1} e^{-t} \, \mathrm{d}t,$$

and $\Gamma(z,0) = \Gamma(z)$ is called the gamma function. The logarithmic derivative of $\Gamma(z)$, denoted by $\psi(z) = \Gamma'(z)/\Gamma(z)$, is called the psi or digamma function, and $\psi^{(k)}$ for $k \in \mathbb{N}$ are called the polygamma functions. One of the elementary properties of the gamma function is $\Gamma(x+1) = x\Gamma(x)$. In particular, $\Gamma(n+1) = n!$.

In [13], it was proved by F. Qi that the functions

(1.3)
$$f(s,r) = \left[\frac{\Gamma(s)}{\Gamma(r)}\right]^{\frac{1}{s-r}},$$

(1.4)
$$f(s,r,x) = \left[\frac{\Gamma(s,x)}{\Gamma(r,x)}\right]^{\frac{1}{s-r}}$$

Monotonicity and Concavity Properties of Some Functions Involving the Gamma Function with Applications

J. Ineq. Pure and Appl. Math. 7(2) Art. 45, 2006 http://jipam.vu.edu.au

and

(1.5)
$$g(s,r,x) = \left[\frac{\gamma(s,x)}{\gamma(r,x)}\right]^{\frac{1}{s-r}}$$

are increasing with respect to r > 0, s > 0, or x > 0.

E. A. Karatsuba [9] proved that the function

(1.6)
$$f_1(x) = [g(x)]^6 - (8x^3 + 4x^2 + x),$$

where

(1.7)
$$g(x) = \left(\frac{e}{x}\right)^x \frac{\Gamma(1+x)}{\sqrt{\pi}},$$

is strictly increasing from $[1,\infty)$ onto $[f_1(1),f_1(\infty))$ with

$$f_1(1) = \frac{e^6}{\pi^3} - 13$$
 and $f_1(\infty) = \frac{1}{30}$

In 2003, in [1], H. Alzer proved that

$$\alpha \le f_1(x) < \frac{1}{30}, \quad x \in (0, \infty),$$

where

$$\alpha = \min_{x>0} f_1(x) = 0.0100450 \dots = f_1(x_0)$$

for some $x_0 \in [0.6, 0.7]$. Since $f_1(x_0) < f_1(1)$ and

$$f_1(x_0) < \lim_{x \to 0+} f_1(x) = \frac{1}{\sqrt{\pi}}$$

Monotonicity and Concavity Properties of Some Functions Involving the Gamma Function with Applications

J. Ineq. Pure and Appl. Math. 7(2) Art. 45, 2006 http://jipam.vu.edu.au

his result shows that $f_1(x)$ is not still monotonic on (0, 1].

In [3], it was shown in 1997, by G. Anderson and S. Qiu, that the function

(1.8)
$$f_2(x) = \frac{\ln \Gamma(x+1)}{x \ln x}$$

is strictly increasing from $(1, \infty)$ onto $(1-\gamma, 1)$, where γ is the Euler-Mascheroni constant. H. Alzer, in 1998 in [2], proved that $f_2(x)$, with

(1.9)
$$f_2(1) = \lim_{x \to 1} f_2(x) = 1 - \gamma,$$

is strictly increasing on $(0, \infty)$. Also note that the function $f_2(x)$ was proved to be concave on $(1, \infty)$ in [6] in 2000 by A. Elbert and A. Laforgia.

In [5, 8, 10, 12, 14, 17], monotonicity properties of other functions related to the (di)gamma function were obtained.

In this article, we shall give some monotonicity and concavity properties of several functions involving the gamma function and, as applications, deduce some equivalence sequences to the sequence n! with best equivalence constants.

Our main results are as follows.

Theorem 1.1. The functions

(1.10)
$$f(x) = \frac{x^{x+\frac{1}{2}}}{e^x \Gamma(x+1)}$$

and

(1.11)
$$F(x) = \frac{e^x \Gamma(x+1)}{x^x}$$

Monotonicity and Concavity Properties of Some Functions Involving the Gamma Function with Applications

J. Ineq. Pure and Appl. Math. 7(2) Art. 45, 2006 http://jipam.vu.edu.au

are strictly logarithmically concave and strictly increasing from $(0, \infty)$, respectively, onto $(0, 1/\sqrt{2\pi})$ and onto $(1, \infty)$.

Theorem 1.2. The function

(1.12)
$$g(x) = \frac{e^x \Gamma(x+1)}{\left(x+\frac{1}{2}\right)^{x+\frac{1}{2}}}$$

is strictly logarithmically concave and strictly increasing from $\left(-\frac{1}{2},\infty\right)$ onto $\left(\sqrt{\pi/e},\sqrt{2\pi/e}\right)$.

Theorem 1.3. The function

(1.13)
$$h(x) = \frac{e^x \Gamma(x+1)\sqrt{x-1}}{x^{x+1}}$$

is strictly logarithmically concave and strictly increasing from $(1, \infty)$ onto $(0, \sqrt{2\pi})$.

As applications of these theorems, we have the following corollaries.

Corollary 1.4. For $n \in \mathbb{N}$,

(1.14)
$$n! \simeq e^{-n} n^{n+1/2}$$

Moreover, for all $n \in \mathbb{N}$ *,*

(1.15)
$$\sqrt{2\pi} \cdot e^{-n} n^{n+1/2} < n! \le e \cdot e^{-n} n^{n+1/2}$$

The equivalence constants $\sqrt{2\pi}$ and e in (1.15) are best possible.

Corollary 1.5. For $n \in \mathbb{N}_0$,

(1.16)
$$n! \simeq e^{-n} \left(n + \frac{1}{2} \right)^{n + \frac{1}{2}}$$

Moreover, for all $n \in \mathbb{N}_0$ *,*

(1.17)
$$\sqrt{2} e^{-n} \left(n + \frac{1}{2} \right)^{n + \frac{1}{2}} \le n! < \sqrt{\frac{2\pi}{e}} e^{-n} \left(n + \frac{1}{2} \right)^{n + \frac{1}{2}}$$

The equivalence constants $\sqrt{2}$ and $\sqrt{2\pi/e}$ in (1.17) are best possible. Corollary 1.6. For $n \ge 2$,

(1.18)
$$n! \simeq \sqrt{\frac{n}{n-1}} e^{-n} n^{n+1/2}$$

Furthermore, for all $n \geq 2$,

(1.19)
$$\left(\frac{e}{2}\right)^2 \sqrt{\frac{n}{n-1}} e^{-n} n^{n+1/2} \le n! < \sqrt{2\pi} \sqrt{\frac{n}{n-1}} e^{-n} n^{n+1/2}.$$

The equivalence constants $(e/2)^2$ and $\sqrt{2\pi}$ in (1.19) are best possible. **Remark 1.** In [16, Theorem 5], it was proved that for $n \ge 2$,

(1.20)
$$\sqrt{2\pi} e^{-n} n^{n+1/2} < n! < \left(\frac{n}{n-1}\right)^{\frac{1}{2}} \sqrt{2\pi} e^{-n} n^{n+1/2},$$

which can be directly deduced from (1.15) and (1.19).

Monotonicity and Concavity Properties of Some Functions Involving the Gamma Function with Applications

J. Ineq. Pure and Appl. Math. 7(2) Art. 45, 2006 http://jipam.vu.edu.au

2. Lemmas

We need the following lemmas to prove our results.

Lemma 2.1 ([4, p. 20]). As $x \to \infty$,

(2.1)
$$\ln \Gamma(x) = \left(x - \frac{1}{2}\right) \ln x - x + \ln \sqrt{2\pi} + O\left(\frac{1}{x}\right).$$

Lemma 2.2 ([7, p. 892] and [11, p. 17]). For x > 0,

(2.2)
$$\psi(x) = \ln x - \frac{1}{2x} - 2 \int_0^\infty \frac{t \, \mathrm{d}t}{(t^2 + x^2)(e^{2\pi t} - 1)},$$

(2.3)
$$\psi\left(x+\frac{1}{2}\right) = \ln x + 2\int_0^\infty \frac{t\,\mathrm{d}t}{(t^2+4x^2)(e^{\pi t}+1)}.$$

Lemma 2.3. The function

(2.4)
$$\varphi(x) = \ln \frac{x+1}{x+\frac{1}{2}} - \frac{1}{2x}$$

is strictly increasing from $(0, \infty)$ onto $(-\infty, 0)$.

Proof. We omit the proof of this lemma due to its simplicity.

Monotonicity and Concavity Properties of Some Functions Involving the Gamma Function with Applications

J. Ineq. Pure and Appl. Math. 7(2) Art. 45, 2006 http://jipam.vu.edu.au

3. Proof of Main Results

Proof of Theorem 1.1. Taking the logarithm of f(x) defined by (1.10) and differentiating directly yields

(3.1)
$$\ln f(x) = \left(x - \frac{1}{2}\right)\ln x - x - \ln\Gamma(x),$$

(3.2)
$$[\ln f(x)]' = \ln x - \frac{1}{2x} - \psi(x).$$

Then by formula (2.2) of Lemma 2.2,

(3.3)
$$[\ln f(x)]' = 2 \int_0^\infty \frac{t \, \mathrm{d}t}{(t^2 + x^2)(e^{2\pi t} - 1)}, \quad x > 0.$$

Hence, $[\ln f(x)]' > 0$ for $x \in (0, \infty)$, which means that $\ln f(x)$, and then f(x), is strictly increasing on $(0, \infty)$.

It is easy to see that $\lim_{x\to 0+} f(x) = 0$. By (3.1) and Lemma 2.1, we have

(3.4)
$$\ln f(x) = -\ln\sqrt{2\pi} + O\left(\frac{1}{x}\right) \to \ln\frac{1}{\sqrt{2\pi}}, \quad x \to \infty,$$

which implies $\lim_{x\to\infty} f(x) = 1/\sqrt{2\pi}$.

Taking the logarithm of F(x) defined by (1.11) and differentiating easily gives

- (3.5) $\ln F(x) = x + \ln \Gamma(x+1) x \ln x,$
- (3.6) $[\ln F(x)]' = \psi(x+1) \ln x.$

Monotonicity and Concavity Properties of Some Functions Involving the Gamma Function with Applications

J. Ineq. Pure and Appl. Math. 7(2) Art. 45, 2006 http://jipam.vu.edu.au

Then by (2.3) of Lemma 2.2, for all x > 0,

(3.7)
$$[\ln F(x)]' = \ln\left(1 + \frac{1}{2x}\right) + 2\int_0^\infty \frac{t\,\mathrm{d}t}{\left[t^2 + 4\left(x + \frac{1}{2}\right)^2\right](e^{\pi t} + 1)} > 0.$$

Hence, $\ln F(x)$, and then F(x), is strictly increasing on $(0, \infty)$. It is easy to see that $\lim_{x\to 0+} F(x) = 1$. By using Lemma 2.1, from (3.5),

(3.8)
$$\ln F(x) = \frac{1}{2}\ln x + \ln\sqrt{2\pi} + O\left(\frac{1}{x}\right), \quad x \to \infty.$$

Therefore, $\ln F(x)$, and then F(x) tends to ∞ as $x \to \infty$.

Formulas (3.3) and (3.7) tell us that $[\ln f(x)]'$ and $[\ln F(x)]'$ are both strictly decreasing. Therefore, $\ln f(x)$ and $\ln F(x)$ are strictly concave, that is, the function f(x) and F(x) are both logarithmically concave.

Proof of Theorem 1.2. Taking the logarithm of g(x) defined by (1.12) and differentiating shows

(3.9)
$$\ln g(x) = x + \ln \Gamma(x+1) - \left(x + \frac{1}{2}\right) \ln \left(x + \frac{1}{2}\right),$$

(3.10) $[\ln g(x)]' = \psi(x+1) - \ln\left(x+\frac{1}{2}\right).$

Then, by formula (2.3) of Lemma 2.2, we have

(3.11)
$$[\ln g(x)]' = 2 \int_0^\infty \frac{t \, \mathrm{d}t}{[t^2 + (2x+1)^2](e^{\pi t}+1)}, \quad x > -\frac{1}{2}$$

Monotonicity and Concavity Properties of Some Functions Involving the Gamma Function with Applications

J. Ineq. Pure and Appl. Math. 7(2) Art. 45, 2006 http://jipam.vu.edu.au

So

(3.12)
$$[\ln g(x)]' > 0, \quad x \in \left(-\frac{1}{2}, \infty\right),$$

which means that $\ln g(x)$, then g(x), is strictly increasing on $\left(-\frac{1}{2},\infty\right)$. Since $\Gamma(1/2) = \sqrt{\pi}$, it is easy to verify that $\lim_{x \to -1/2} g(x) = \sqrt{\pi/e}$. From (3.9) and Lemma 2.1, it is obtained that

(3.13)
$$\ln g(x) = \left(x + \frac{1}{2}\right) \ln \frac{x+1}{x+\frac{1}{2}} + \ln \sqrt{2\pi} - 1 + O\left(\frac{1}{x}\right), \quad x \to \infty.$$

Hence $\ln g(x) \to \ln \sqrt{2\pi/e}$ as $x \to \infty$, and then $\lim_{x \to \infty} g(x) = \sqrt{2\pi/e}$.

Formula (3.11) shows that $[\ln g(x)]'$ is strictly decreasing. Therefore, $\ln g(x)$ is strictly concave, that is, the function g(x) is logarithmically concave.

Proof of Theorem 1.3. Taking the logarithm of h(x) defined by (1.13) and differentiating straightforwardly reveals

(3.14)
$$\ln h(x) = \ln \Gamma(x) + x + \frac{1}{2}\ln(x-1) - x\ln x,$$

(3.15)
$$[\ln h(x)]' = \psi(x) + \frac{1}{2(x-1)} - \ln x.$$

By setting x = u + 1 with u > 0, we have

(3.16)
$$[\ln h(x)]' = \psi(u+1) + \frac{1}{2u} - \ln(u+1) = [\ln g(u)]' - \varphi(u),$$

Monotonicity and Concavity Properties of Some Functions Involving the Gamma Function with Applications

J. Ineq. Pure and Appl. Math. 7(2) Art. 45, 2006 http://jipam.vu.edu.au

where g(u) and $\varphi(u)$ are respectively defined by (1.12) and (2.4). From (3.12) and Lemma 2.3, it is deduced that $[\ln h(x)]' > 0$ for x > 1. Therefore, $\ln h(x)$, and then h(x), is strictly increasing on $(1, \infty)$.

It is obvious that $\lim_{x \to 1+} h(x) = 0$. From (3.14) and Lemma 2.1, we see

(3.17)
$$\ln h(x) = \frac{1}{2} \ln \frac{x-1}{x} + \ln \sqrt{2\pi} + O\left(\frac{1}{x}\right) \to \ln \sqrt{2\pi}, \quad x \to \infty.$$

So $\lim_{x \to \infty} h(x) = \sqrt{2\pi}$.

Considering the logarithmic concavity of g(x) and the increasing monotonicity of $\varphi(x)$ in (3.16) reveals that $[\ln h(x)]'$ is strictly decreasing. Therefore, $\ln h(x)$ is strictly concave, that is, the function h(x) is logarithmically concave.

Proof of Corollary 1.4. By Theorem 1.1, we know that the function f(x) is strictly increasing from $(0, \infty)$ onto $\left(0, \frac{1}{\sqrt{2\pi}}\right)$, hence

(3.18)
$$\frac{1}{e} = f(1) \le f(n) = \frac{n^{n+1/2}}{e^n n!} < \frac{1}{\sqrt{2\pi}}$$

for $n \in \mathbb{N}$, and

(3.19)
$$\lim_{n \to \infty} \frac{n^{n+1/2}}{e^n n!} = \frac{1}{\sqrt{2\pi}}.$$

From (3.18) and (3.19), we see that Corollary 1.4 is true.

Monotonicity and Concavity Properties of Some Functions Involving the Gamma Function with Applications

J. Ineq. Pure and Appl. Math. 7(2) Art. 45, 2006 http://jipam.vu.edu.au

Proof of Corollary 1.5. By Theorem 1.2, we see that the function g(x) is strictly increasing from $\left(-\frac{1}{2},\infty\right)$ onto $\left(\sqrt{\pi/e},\sqrt{2\pi/e}\right)$. So

(3.20)
$$\sqrt{2} = g(0) \le g(n) = \frac{e^n n!}{\left(n + \frac{1}{2}\right)^{n+1/2}} < \sqrt{\frac{2\pi}{e}}, \quad n \in \mathbb{N}_0$$

and

(3.21)
$$\lim_{n \to \infty} \frac{e^n n!}{\left(n + \frac{1}{2}\right)^{n+1/2}} = \sqrt{\frac{2\pi}{e}}.$$

Inequality (3.20) is equivalent to (1.17). Since the constants $\sqrt{2}$ and $\sqrt{2\pi/e}$ are best possible in (3.20), they are also best possible in (1.17).

Proof of Corollary 1.6. The monotonicity of h(x) by Theorem 1.3 implies

(3.22)
$$\left(\frac{e}{2}\right)^2 = h(2) \le h(n) = \frac{e^n n! \sqrt{n-1}}{n^{n+1}} < \sqrt{2\pi}, \quad n \ge 2$$

and

(3.23)
$$\lim_{n \to \infty} \frac{e^n n! \sqrt{n-1}}{n^{n+1}} = \sqrt{2\pi}.$$

From (3.22) and (3.23), we see that Corollary 1.6 is valid.
