# Efficient Lower Bounds on the Number of Repetition-free Words 

Roman Kolpakov ${ }^{1}$<br>Lomonosov Moscow State University<br>Vorobjovy Gory<br>119992 Moscow<br>Russia<br>foroman@mail.ru

#### Abstract

We propose a new effective method for obtaining lower bounds on the number of repetition-free words over a finite alphabet.

## 1 Introduction

Repetition-free words over finite alphabets are a traditional object of research in combinatorics of words. A word $w$ over an alphabet $\Sigma$ is a finite sequence $a_{1} \cdots a_{n}$ of symbols from $\Sigma$. The number $n$ is called the length of $w$ and is denoted by $|w|$. The symbol $a_{i}$ of $w$ is denoted by $w[i]$. A word $a_{i} \cdots a_{j}$, where $1 \leq i \leq j \leq n$, is called a factor of $w$ and is denoted by $w[i: j]$. For any $i=1, \ldots, n$ the factor $w[1: i](w[i: n])$ is called a prefix (a suffix) of $w$. A positive integer $p$ is called a period of $w$ if $a_{i}=a_{i+p}$ for each $i=1, \ldots, n-p$. If $p$ is the minimal period of $w$, the ratio $n / p$ is called the exponent of $w$. Two words $w^{\prime}, w^{\prime \prime}$ over $\Sigma$ are called isomorphic if $\left|w^{\prime}\right|=\left|w^{\prime \prime}\right|$ and there exists a bijection $\sigma: \Sigma \longrightarrow \Sigma$ such that $w^{\prime \prime}[i]=\sigma\left(w^{\prime}[i]\right), i=1, \ldots,\left|w^{\prime}\right|$. The set of all words over $\Sigma$ is denoted by $\Sigma^{*}$.

For any finite set $A$ we denote by $|A|$ the number of elements of $A$. Let $W$ be an arbitrary set of words. This set is called factorial if for any word $w$ from $W$ all factors of $w$ are also contained in $W$. We denote by $W(n)$ the subset of $W$ consisting of all words of length $n$. If $W$ is factorial then it is not difficult to show (see, e.g., $[4,1]$ ) that there exists the limit

[^0]$\lim _{n \rightarrow \infty} \sqrt[n]{|W(n)|}$ which is called the growth rate of words from $W$. For any word $v$ and any $n \geq|v|$ we denote by $W^{(v)}(n)$ the set of all words from $W(n)$ which contain $v$ as a suffix.

By a repetition we mean any word of exponent greater than 1 . The best known example of a repetition is a square; that is, a word of the form $u u$, where $u$ is an arbitrary nonempty word. Avoiding ambiguity ${ }^{2}$, by the period of the square $u u$ we mean the length of $u$. In an analogous way, a cube is a word of the form uuu for a nonempty word $u$, a the period of this cube is also the length of $u$. A word is called square-free (cube-free) if it contains no squares (cubes) as factors. It is easy to see that there are no binary square-free words of length more than 3. On the other hand, by the classical results of Thue [19, 20], there exist ternary square-free words of arbitrary length and binary cube-free words of arbitrary length. If we denote by $S^{\langle\mathrm{sf}\rangle}(n)$ the number of ternary square-free words of length $n$ and by $S^{\langle\mathrm{cf}\rangle}(n)$ the number of binary cube-free words of length $n$, we then have that $S^{\langle\mathrm{Sf}\rangle}(n)>0$ and $S^{\langle\mathrm{cf}\rangle}(n)>0$ for any $n$. For ternary square-free words this result was strengthened by Dejean in [7]. She found ternary words of arbitrary length which have no factors with exponents greater than $7 / 4$. On the other hand, she showed that any long enough ternary word contains a factor with an exponent greater than or equal to $7 / 4$. Thus, the number $7 / 4$ is the minimal limit for exponents of prohibited factors in arbitrarily long ternary words. For this reason we call ternary words having no factors with exponents greater than $7 / 4$ minimally repetitive ternary words. Dejean conjectured also that the minimal limit for exponents of prohibited factors in arbitrarily long words over a $k$-letter alphabet is equal to $7 / 5$ for $k=4$ and $k / k-1$ for $k \geq 5$. This conjecture was proved for $k=4$ by Pansiot [17], for $5 \leq k \leq 11$ by Moulin Ollagnier [14], for $12 \leq k \leq 14$ by Mohammad-Noori and Currie [13], and for $k \geq 38$ by Carpi [5]. Denote by $S^{\langle\mathrm{lf}\rangle}(n)$ the number of minimally repetitive ternary words of length $n$. It follows from the result of Dejean that $S^{\langle\mathrm{lf}\rangle}(n)>0$ for any $n$.

Note that the set of all ternary square-free words, the set of all binary cube-free words, and the set of all minimally repetitive ternary words are factorial. So there exist the growth rates $\gamma^{\langle\mathrm{Sf}\rangle}=\lim _{n \rightarrow \infty} \sqrt[n]{S^{\langle\mathrm{Sf}\rangle}(n)}, \gamma^{\langle\mathrm{Cf}\rangle}=\lim _{n \rightarrow \infty} \sqrt[n]{S^{\langle\mathrm{Cf}\rangle}(n)}, \gamma^{\langle\mathrm{lf}\rangle}=\lim _{n \rightarrow \infty} \sqrt[n]{S^{\langle\mathrm{lf}\rangle}(n)}$ of words from these sets. Brandenburg proved in [3] that the values $S^{\langle\mathrm{sf}\rangle}(n)$ and $S^{\langle\mathrm{Cf}\rangle}(n)$ grew exponentially with $n$, namely, $S^{\langle\mathrm{Sf}\rangle}(n) \geq 6 \cdot 1.032^{n}$ and $S^{\langle\mathrm{Cf}\rangle}(n) \geq 2 \cdot 1.080^{n}$, i. e. $\gamma^{\langle\mathrm{Sf}\rangle} \geq 1.032$ and $\gamma^{\langle\mathrm{Cf}\rangle} \geq 1.080$. Later the lower bound for $\gamma^{\langle\mathrm{Sf}\rangle}$ was improved consecutively ${ }^{3}$ by Ekhad, Zeilberger, Grimm, and Sun in [9, 10, 18]. The best upper bounds known at present $\gamma^{\langle\mathrm{Sf}\rangle}<1.30178858$ and $\gamma^{\langle\mathrm{Cf}\rangle}<1.4576$ are obtained by Ochem and Edlin in [16] and [8] respectively. In [15] Ochem established the exponential growth of the number of minimally repetitive words over either a three-letter or a four-letter alphabet. However, this result does not give any significant lower bound for $\gamma^{\langle l f\rangle}$.

In [12] we proposed a new method for obtaining lower bounds on the number of repetitionfree words. This method is essentially based on inductive estimation of the number of words which contain repetitions as factors. Using this method, we obtained the bounds $\gamma^{\langle\mathrm{Sf}\rangle} \geq 1.30125$ and $\gamma^{\langle\mathrm{Cf}\rangle} \geq 1.456975$. The main drawback of the proposed method was the large size of computer computations required. In particular, for this reason we did

[^1]not manage to obtain a lower bound for $\gamma^{\langle\mathrm{lf}\rangle}$ by the proposed method. In this paper we propose a modification of the given method which requires a much less size of computer computations. Using this modification, we obtain the bounds $\gamma^{\langle\mathrm{Sf}\rangle} \geq 1.30173, \gamma^{\langle\mathrm{lf}\rangle} \geq 1.245$, and $\gamma^{\langle\mathrm{Cf}\rangle} \geq 1.457567$. Comparing the obtained lower bounds for $\gamma^{\langle\mathrm{Sf}\rangle}$ and $\gamma^{\langle\mathrm{Cf}\rangle}$ with the known upper bounds, one can conclude that we have estimated $\gamma^{\langle\mathrm{Sf}\rangle}$ and $\gamma^{\langle\mathrm{Cf}\rangle}$ within a precision of 0.0001 , which demonstrates the high efficiency of the proposed modification.

## 2 Estimation for the number of ternary square-free words

For obtaining a lower bound on $\gamma^{\langle\mathrm{Sf}\rangle}$ we consider the alphabet $\Sigma_{3}=\{0,1,2\}$. Denote the set of all square-free words from $\Sigma_{3}^{*}$ by $\mathcal{F}$. Let $m$ be a natural number, $m>2$, and $w^{\prime}, w^{\prime \prime}$ be two words from $\mathcal{F}(m)$. We call the word $w^{\prime \prime}$ a descendant of the word $w^{\prime}$ if $w^{\prime}[2: m]=w^{\prime \prime}[1: m-1]$ and $w^{\prime} w^{\prime \prime}[m]=w^{\prime}[1] w^{\prime \prime} \in \mathcal{F}(m+1)$. The word $w^{\prime}$ is called in this case an ancestor of the word $w^{\prime \prime}$. Further, we introduce a notion of closed words in the following inductive way. A word $w$ from $\mathcal{F}(m)$ is called right closed (left closed) if and only if this word satisfies one of the two following conditions:
(a) Basis of induction. $w$ has no descendants (ancestors);
(b) Inductive step. All descendants (ancestors) of $w$ are right closed (left closed). A word is closed if it is either right closed or left closed. Denote by $\mathcal{L}_{m}$ the set of all words from $\Sigma_{3}^{*}$ which do not contain closed words from $\mathcal{F}(m)$ as factors. By $\mathcal{F}_{m}$ we denote the set of all square-free words from $\mathcal{L}_{m}$. Note that a word $w$ is closed if and only if any word isomorphic to $w$ is also closed. So we have the following obvious fact.

Proposition 2.1. For any isomorphic words $w^{\prime}$, $w^{\prime \prime}$ and any $n \geq\left|w^{\prime}\right|$ the equality $\left|\mathcal{F}_{m}^{\left(w^{\prime}\right)}(n)\right|=$ $\left|\mathcal{F}_{m}^{\left(w^{\prime \prime}\right)}(n)\right|$ holds.

By $\mathcal{F}^{\prime}(m)$ we denote the set of all words $w$ from $\mathcal{F}(m)$ such that $w[1]=0$ and $w[2]=1$. It is obvious that for any word $w$ from $\mathcal{F}(m)$ there exists a single word from $\mathcal{F}^{\prime}(m)$ which is isomorphic to $w$. Let $w^{\prime}, w^{\prime \prime}$ be two words from $\mathcal{F}^{\prime}(m)$. We call the word $w^{\prime \prime}$ a quasidescendant of the word $w^{\prime}$ if $w^{\prime \prime}$ is isomorphic to some descendant of $w^{\prime}$. The word $w^{\prime}$ is called in this case a quasi-ancestor of the word $w^{\prime \prime}$. Let $\mathcal{F}^{\prime \prime}(m)$ be the set of all words from $\mathcal{F}^{\prime}(m)$ which are not closed. Since ternary square-free words of arbitrary length exist, $\mathcal{F}^{\prime \prime}(m)$ is not empty for any $m$. Denote $s=\left|\mathcal{F}^{\prime \prime}(m)\right|$. We enumerate all words from $\mathcal{F}^{\prime \prime}(m)$ by numbers $1,2, \ldots, s$ in lexicographic order and denote $i$-th word of the set $\mathcal{F}^{\prime \prime}(m)$ by $w_{i}$, $i=1, \ldots, s$. Then we define a matrix $\Delta_{m}=\left(\delta_{i j}\right)$ of size $s \times s$ in the following way: $\delta_{i j}=1$ if and only if $w_{i}$ is an quasi-ancestor of $w_{j}$; otherwise $\delta_{i j}=0$. Note that $\Delta_{m}$ is a nonnegative matrix, so, by Perron-Frobenius theorem, for $\Delta_{m}$ there exists some maximal in modulus eigenvalue $r$ which is a nonnegative real number. Moreover, we can find some eigenvector $\tilde{x}=\left(x_{1} ; \ldots ; x_{s}\right)$ with nonnegative components which corresponds to $r$. Assume that $r>1$ and all components of $\tilde{x}$ are positive. For $n \geq m$ define $S_{m}^{\langle\mathrm{Sf} \mathrm{\rangle}}(n)=\sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{F}_{m}^{\left(w_{i}\right)}(n)\right|$. In an inductive way we estimate $S_{m}^{\langle\mathrm{Sf}\rangle}(n+1)$ by $S_{m}^{\langle\mathrm{Sf} \mathrm{\rangle}}(n)$.

First we estimate $\left|\mathcal{F}_{m}^{\left(w_{i}\right)}(n+1)\right|$ for $i=1, \ldots, s$. It is obvious that

$$
\begin{equation*}
\left|\mathcal{F}_{m}^{\left(w_{i}\right)}(n+1)\right|=\left|\mathcal{G}^{\left(w_{i}\right)}(n+1)\right|-\left|\mathcal{H}^{\left(w_{i}\right)}(n+1)\right| \tag{1}
\end{equation*}
$$

where $\mathcal{G}^{\left(w_{i}\right)}(n+1)$ is the set of all words $w$ from $\mathcal{L}_{m}^{\left(w_{i}\right)}(n+1)$ such that the words $w[1: n]$ and $w[n-m+1: n+1]$ are square-free, and $\mathcal{H}^{\left(w_{i}\right)}(n+1)$ is the set of all words from $\mathcal{G}^{\left(w_{i}\right)}(n+1)$ which contain some square as a suffix. Denote by $\pi(i)$ the set of all quasi-ancestors of $w_{i}$. Taking into account Proposition 2.1, it is easy to see that

$$
\begin{equation*}
\left|\mathcal{G}^{\left(w_{i}\right)}(n+1)\right|=\sum_{w \in \pi(i)}\left|\mathcal{F}_{m}^{(w)}(n)\right| . \tag{2}
\end{equation*}
$$

We now estimate $\left|\mathcal{H}^{\left(w_{i}\right)}(n+1)\right|$. For any word $w$ from $\mathcal{H}^{\left(w_{i}\right)}(n+1)$ we can find the minimal square which is a suffix of $w$. Denote the period of this square by $\lambda(w)$. It is obvious that $\lfloor(m+1) / 2\rfloor<\lambda(w) \leq\lfloor(n+1) / 2\rfloor$. Denote by $\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)$ the set of all words $w$ from $\mathcal{H}^{\left(w_{i}\right)}(n+1)$ such that $\lambda(w)=j$. Then

$$
\begin{equation*}
\left|\mathcal{H}^{\left(w_{i}\right)}(n+1)\right|=\sum_{\lfloor(m+1) / 2\rfloor<j \leq\lfloor(n+1) / 2\rfloor}\left|\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)\right| . \tag{3}
\end{equation*}
$$

Take some integer $p \geq m$ and assume that $n \geq 2 p$. Consider a set $\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)$ where $j \leq p$. Let $w$ be an arbitrary word from this set. Then the suffix $w[n-2 j+2: n+1]$ is a square which contains neither closed words from $\mathcal{F}(m)$ nor other squares as factors and contains the word $w_{i}$ as a suffix. Let $v_{1}, \ldots, v_{t}$ be all possible squares of period $j$ which satisfy the given conditions. Denote by $\mathcal{H}_{j, k}^{\left(w_{i}\right)}(n+1)$ the set of all words from $\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)$ which contain the square $v_{k}$ as a suffix, $k=1, \ldots, t$. Let $w \in \mathcal{H}_{j, k}^{\left(w_{i}\right)}(n+1)$. Since the prefix $w[1: n]$ is square-free, in this case we have $w[n-2 j+1] \neq w[n-2 j+2]=v_{k}[1]$ and $w[n-2 j+1] \neq w[n-j+1]=v_{k}[j]$. Moreover, $v_{k}[1]=w[n-j+2] \neq w[n-j+1]=v_{k}[j]$. Thus, the symbol $w[n-2 j+1]$ is determined uniquely by $v_{k}$ as the symbol from $\Sigma_{3}$ which is different from the two distinct symbols $v_{k}[1]$ and $v_{k}[j]$. Denoting this symbol by $b_{k}$, we conclude that $v_{k}$ determines uniquely the factor $w[n-2 j+1: n]$ as the word $b_{k} v_{k}[1: 2 j-1]$. Therefore, if this word is not square-free or contains a closed word from $\mathcal{F}(m)$ as a factor then $\mathcal{H}_{j, k}^{\left(w_{i}\right)}(n+1)=\emptyset$. Let $b_{k} v_{k}[1: 2 j-1] \in \mathcal{F}_{m}$. Then define $u_{k}=b_{k} v_{k}[1: m-1]=w[n-2 j+1: n-2 j+m]$. Since $w$ is determined uniquely by the prefix $w[1: n-2 j]$, we have $\left|\mathcal{H}_{j, k}^{\left(w_{i}\right)}(n+1)\right| \leq\left|\mathcal{F}_{m}^{\left(u_{k}\right)}(n-2 j+m)\right|$. Denote by $u_{k}^{\prime}$ the word from $\mathcal{F}^{\prime}(m)$ which is isomorphic to $u_{k}$. Then, by Proposition 2.1, we have

$$
\left|\mathcal{H}_{j, k}^{\left(w_{i}\right)}(n+1)\right| \leq\left|\mathcal{F}_{m}^{\left(u_{k}^{\prime}\right)}(n-2 j+m)\right| .
$$

Thus, denoting by $U_{j}\left(w_{i}\right)$ the set of all words ${ }^{4} u_{k}^{\prime}$, we obtain that

$$
\begin{equation*}
\left|\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)\right|=\sum_{k=1}^{t}\left|\mathcal{H}_{j, k}^{\left(w_{i}\right)}(n+1)\right| \leq \sum_{u \in U_{j}\left(w_{i}\right)}\left|\mathcal{F}_{m}^{(u)}(n-2 j+m)\right| \tag{4}
\end{equation*}
$$

[^2]Consider now the set $\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)$ for $j>p$. Note that in this case $j>m$. Let $w$ be an arbitrary word from $\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)$. Then for $w$ we have $w[n-2 j+2: n-j+1]=w[n-j+2$ : $n+1$ ], i.e., $w[n-j-m+2: n-j+1]=w_{i}$ and $w$ is determined uniquely by the prefix $w[1: n-j-m+1]$. Therefore, in this case the inequality

$$
\begin{equation*}
\left|\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)\right| \leq\left|\mathcal{F}_{m}^{\left(w_{i}\right)}(n-j+1)\right| . \tag{5}
\end{equation*}
$$

holds. Using inequalities (4) and (5) in (3), we obtain

$$
\begin{equation*}
\left|\mathcal{H}^{\left(w_{i}\right)}(n+1)\right| \leq A_{p}^{\left(w_{i}\right)}(n+1)+B_{p}^{\left(w_{i}\right)}(n+1) \tag{6}
\end{equation*}
$$

where

$$
\begin{aligned}
A_{p}^{\left(w_{i}\right)}(n+1) & =\sum_{\lfloor(m+1) / 2\rfloor<j \leq p}\left(\sum_{u \in U_{j}\left(w_{i}\right)}\left|\mathcal{F}_{m}^{(u)}(n-2 j+m)\right|\right), \\
B_{p}^{\left(w_{i}\right)}(n+1) & =\sum_{p<j \leq\lfloor(n+1) / 2\rfloor}\left|\mathcal{F}_{m}^{\left(w_{i}\right)}(n-j+1)\right| .
\end{aligned}
$$

We now estimate $S_{m}^{\langle\mathrm{Sf}\rangle}(n+1)$. Using equality (1), we have

$$
\begin{equation*}
S_{m}^{\langle\mathrm{Sf}\rangle}(n+1)=\sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{G}^{\left(w_{i}\right)}(n+1)\right|-\sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{H}^{\left(w_{i}\right)}(n+1)\right| . \tag{7}
\end{equation*}
$$

Recall that $\tilde{x}$ is a eigenvector of $\Delta_{m}$ for the eigenvalue $r$. So, applying equality (2), we obtain

$$
\begin{align*}
& \sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{G}^{\left(w_{i}\right)}(n+1)\right|=\sum_{i=1}^{s}\left(x_{i} \cdot \sum_{w \in \pi(i)}\left|\mathcal{F}_{m}^{(w)}(n)\right|\right) \\
& =\left(x_{1} ; x_{2} ; \ldots ; x_{s}\right)\left(\begin{array}{cccc}
\delta_{11} & \delta_{21} & \ldots & \delta_{s 1} \\
\delta_{12} & \delta_{22} & \ldots & \delta_{s 2} \\
\vdots & \vdots & \ddots & \vdots \\
\delta_{1 s} & \delta_{2 s} & \ldots & \delta_{s s}
\end{array}\right)\left(\begin{array}{c}
\left|\mathcal{F}_{m}^{\left(w_{1}\right)}(n)\right| \\
\left|\mathcal{F}_{m}^{\left(w_{2}\right)}(n)\right| \\
\vdots \\
\left|\mathcal{F}_{m}^{\left(w_{s}\right)}(n)\right|
\end{array}\right) \\
& =r \cdot\left(x_{1} ; x_{2} ; \ldots ; x_{s}\right)\left(\begin{array}{c}
\left|\mathcal{F}_{m}^{\left(w_{1}\right)}(n)\right| \\
\left|\mathcal{F}_{m}^{\left(w_{2}\right)}(n)\right| \\
\vdots \\
\left|\mathcal{F}_{m}^{\left(w_{s}\right)}(n)\right|
\end{array}\right)=r \cdot S_{m}^{\langle\text {(Sf }\rangle}(n) . \tag{8}
\end{align*}
$$

For estimating the second sum in the right side of (7) we use equality (6):

$$
\begin{equation*}
\sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{H}^{\left(w_{i}\right)}(n+1)\right| \leq \sum_{i=1}^{s} x_{i} \cdot A_{p}^{\left(w_{i}\right)}(n+1)+\sum_{i=1}^{s} x_{i} \cdot B_{p}^{\left(w_{i}\right)}(n+1) \tag{9}
\end{equation*}
$$

where

$$
\begin{align*}
\sum_{i=1}^{s} x_{i} \cdot B_{p}^{\left(w_{i}\right)}(n+1) & =\sum_{p<j \leq\lfloor(n+1) / 2\rfloor}\left(\sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{F}_{m}^{\left(w_{i}\right)}(n-j+1)\right|\right) \\
& =\sum_{p<j \leq\lfloor(n+1) / 2\rfloor} S_{m}^{\langle\mathrm{Sf}\rangle}(n-j+1) . \tag{10}
\end{align*}
$$

For $k=1, \ldots, s$ denote by $\zeta_{j}^{(k)}\left(w_{i}\right)$ the number of words $w_{k}$ in the set $U_{j}\left(w_{i}\right)$, and define $\eta_{k}(j)$ as $\sum_{i=1}^{s} x_{i} \cdot \zeta_{j}^{(k)}\left(w_{i}\right)$. Note that any word from $U_{j}\left(w_{i}\right)$ belongs to $\mathcal{F}^{\prime \prime}(m)$. Hence

$$
\begin{align*}
\sum_{i=1}^{s} x_{i} \cdot A_{p}^{\left(w_{i}\right)}(n+1) & =\sum_{\lfloor(m+1) / 2\rfloor<j \leq p} \sum_{i=1}^{s} x_{i}\left(\sum_{u \in U_{j}\left(w_{i}\right)}\left|\mathcal{F}_{m}^{(u)}(n-2 j+m)\right|\right) \\
& =\sum_{\lfloor(m+1) / 2\rfloor<j \leq p} \sum_{k=1}^{s} \eta_{k}(j) \cdot\left|\mathcal{F}_{m}^{\left(w_{k}\right)}(n-2 j+m)\right| \tag{11}
\end{align*}
$$

Take some integer $q \geq 2 p-m$ and assume that $n \geq q+m$. For the sake of convenience we present sum (11) as

$$
\sum_{d=d_{0}}^{q} \sum_{k=1}^{s} \eta_{k}^{\prime}(d) \cdot\left|\mathcal{F}_{m}^{\left(w_{k}\right)}(n-d)\right|
$$

where $\eta_{k}^{\prime}(d)=\eta_{k}((d+m) / 2)$ if $d+m$ is even, $\eta_{k}^{\prime}(d)=0$ otherwise, and $d_{0}=2 \cdot\lfloor(m+3) / 2\rfloor-m$. We majorize this sum by some sum $\sum_{d=d_{0}}^{q} \rho_{d} \cdot S_{m}^{\langle\text {Sf }\rangle}(n-d)$ in the following way. We compute consecutively coefficients $\rho_{d}$ of this sum for $d=d_{0}, d_{0}+1, \ldots, q$. For each $d=d_{0}, d_{0}+$ $1, \ldots, q-1$ together with the number $\rho_{d}$ we compute also numbers $\eta_{1}^{\prime \prime}(d+1), \ldots, \eta_{s}^{\prime \prime}(d+1)$ such that

$$
\begin{equation*}
\sum_{j=d_{0}}^{d+1} \sum_{k=1}^{s} \eta_{k}^{\prime}(j) \cdot\left|\mathcal{F}_{m}^{\left(w_{k}\right)}(n-j)\right| \leq \sum_{k=1}^{s} \eta_{k}^{\prime \prime}(d+1) \cdot\left|\mathcal{F}_{m}^{\left(w_{k}\right)}(n-d-1)\right|+\sum_{j=d_{0}}^{d} \rho_{j} \cdot S_{m}^{\langle\mathrm{Sf}\rangle}(n-j) \tag{12}
\end{equation*}
$$

For $d=d_{0}$ we take $\rho_{d_{0}}=\min _{1 \leq k \leq s}\left(\eta_{k}^{\prime}\left(d_{0}\right) / x_{k}\right)$. Then

$$
\sum_{k=1}^{s} \eta_{k}^{\prime}\left(d_{0}\right) \cdot\left|\mathcal{F}_{m}^{\left(w_{k}\right)}\left(n-d_{0}\right)\right|=\rho_{d_{0}} \cdot S_{m}^{\langle\mathrm{Sf}\rangle}\left(n-d_{0}\right)+\sum_{k=1}^{s} \nu_{k} \cdot\left|\mathcal{F}_{m}^{\left(w_{k}\right)}\left(n-d_{0}\right)\right|
$$

where $\nu_{k}=\eta_{k}^{\prime}\left(d_{0}\right)-\rho_{d_{0}} \cdot x_{k}, k=1, \ldots, s$. Denote by $\tilde{\nu}$ the vector $\left(\nu_{1} ; \ldots ; \nu_{s}\right)$ and consider the vector $\tilde{\nu}^{\prime}=\Delta_{m} \tilde{\nu}$. Let $\tilde{\nu}^{\prime}=\left(\nu_{1}^{\prime} ; \ldots ; \nu_{s}^{\prime}\right)$. It follows from (1) and (2) that

$$
\left|\mathcal{F}_{m}^{\left(w_{k}\right)}\left(n-d_{0}\right)\right| \leq\left|\mathcal{G}^{\left(w_{i}\right)}\left(n-d_{0}\right)\right|=\sum_{w \in \pi(k)}\left|\mathcal{F}_{m}^{(w)}\left(n-d_{0}-1\right)\right|
$$

for any $k=1, \ldots, s$. Note also that $\nu_{k} \geq 0$ for $k=1, \ldots, s$. Hence

$$
\begin{aligned}
\sum_{k=1}^{s} \nu_{k} \cdot\left|\mathcal{F}_{m}^{\left(w_{k}\right)}\left(n-d_{0}\right)\right| & \leq \sum_{k=1}^{s}\left(\nu_{k} \cdot \sum_{w \in \pi(k)}\left|\mathcal{F}_{m}^{(w)}\left(n-d_{0}-1\right)\right|\right) \\
& =\sum_{k=1}^{s} \nu_{k}^{\prime} \cdot\left|\mathcal{F}_{m}^{\left(w_{k}\right)}\left(n-d_{0}-1\right)\right|
\end{aligned}
$$

Thus

$$
\begin{equation*}
\sum_{j=d_{0}}^{d_{0}+1} \sum_{k=1}^{s} \eta_{k}^{\prime}(j) \cdot\left|\mathcal{F}_{m}^{\left(w_{k}\right)}(n-j)\right| \leq \rho_{d_{0}} \cdot S_{m}^{\langle\text {Sf }\rangle}\left(n-d_{0}\right)+\sum_{k=1}^{s} \eta_{k}^{\prime \prime}\left(d_{0}+1\right) \cdot\left|\mathcal{F}_{m}^{\left(w_{k}\right)}\left(n-d_{0}-1\right)\right| \tag{13}
\end{equation*}
$$

where $\eta_{k}^{\prime \prime}\left(d_{0}+1\right)=\eta_{k}^{\prime}\left(d_{0}+1\right)+\nu_{k}^{\prime}$. Assume now that for some $d$ such that $d_{0}<d<q$ we already computed the numbers $\rho_{d_{0}}, \ldots, \rho_{d-1}$ and $\eta_{1}^{\prime \prime}(d), \ldots, \eta_{s}^{\prime \prime}(d)$. Then we take $\rho_{d}=$ $\min _{1 \leq k \leq s}\left(\eta_{k}^{\prime \prime}(d) / x_{k}\right), \tilde{\nu}=\left(\eta_{1}^{\prime \prime}(d)-\rho_{d} \cdot x_{1}, \ldots, \eta_{s}^{\prime \prime}(d)-\rho_{d} \cdot x_{s}\right)$, and $\tilde{\nu}^{\prime}=\Delta_{m} \tilde{\nu}$. We take also $\eta_{k}^{\prime \prime}(d+1)=\eta_{k}^{\prime}(d+1)+\nu_{k}^{\prime}$ where $\nu_{k}^{\prime}$ is the $k$-th component of the vector $\tilde{\nu}^{\prime}, k=1, \ldots, s$. Analogously to inequality (13), in this case we have the inequality

$$
\begin{aligned}
& \sum_{k=1}^{s}\left(\eta_{k}^{\prime \prime}(d) \cdot\left|\mathcal{F}_{m}^{\left(w_{k}\right)}(n-d)\right|+\eta_{k}^{\prime}(d+1) \cdot\left|\mathcal{F}_{m}^{\left(w_{k}\right)}(n-d-1)\right|\right) \\
& \quad \leq \rho_{d} \cdot S_{m}^{\langle\text {Sf }\rangle}(n-d)+\sum_{k=1}^{s} \eta_{k}^{\prime \prime}(d+1) \cdot\left|\mathcal{F}_{m}^{\left(w_{k}\right)}(n-d-1)\right|
\end{aligned}
$$

This inequality implies that inequality (12) holds for every $d$. For $d=q$ we take $\rho_{q}=$ $\max _{1 \leq k \leq s}\left(\eta_{k}^{\prime \prime}(q) / x_{k}\right)$. Thus,

$$
\begin{equation*}
\sum_{i=1}^{s} x_{i} A_{p}^{\left(w_{i}\right)}(n+1)=\sum_{d=d_{0}}^{q} \sum_{k=1}^{s} \eta_{k}^{\prime}(d) \cdot\left|\mathcal{F}_{m}^{\left(w_{k}\right)}(n-d)\right| \leq \sum_{d=d_{0}}^{q} \rho_{d} \cdot S_{m}^{\langle\mathrm{Sf}\rangle}(n-d) \tag{14}
\end{equation*}
$$

For the sake of convenience denote by $\mathcal{P}_{m}^{(p, q)}(z)$ the polynomial $\sum_{d=d_{0}}^{q} \rho_{d} \cdot z^{d}$ in a variable $z$.
Let for some $\alpha>1$ and each $i=m, m+1, \ldots, n-1$ the inequality $S_{m}^{\langle\mathrm{Sf}\rangle}(i+1) \geq \alpha S_{m}^{\langle\mathrm{Sf}\rangle}(i)$ be valid. Then for each $i=m, m+1, \ldots, n-1$ we have $S_{m}^{\langle\mathrm{Sf} \mathrm{\rangle}\rangle}(i) \leq S_{m}^{\langle\mathrm{Sf} \mathrm{\rangle}\rangle}(n) / \alpha^{n-i}$. So relation (14) implies that

$$
\sum_{i=1}^{s} x_{i} \cdot A_{p}^{\left(w_{i}\right)}(n+1) \leq \sum_{d=d_{0}}^{q} \rho_{d} \cdot\left(S_{m}^{\langle\mathrm{Sf}\rangle}(n) / \alpha^{d}\right)=\mathcal{P}_{m}^{(p, q)}(1 / \alpha) \cdot S_{m}^{\langle\mathrm{Sf}\rangle}(n)
$$

In an analogous way relation (10) implies that

$$
\begin{aligned}
\sum_{i=1}^{s} x_{i} B_{p}^{\left(w_{i}\right)}(n+1) & \leq \sum_{p<j \leq\lfloor(n+1) / 2\rfloor} S_{m}^{\langle\mathrm{Sf}\rangle}(n) / \alpha^{j-1}<S_{m}^{\langle\mathrm{Sf}\rangle}(n) \cdot \sum_{j=p}^{\infty} 1 / \alpha^{j} \\
& =\frac{S_{m}^{\langle\mathrm{Sf}\rangle}(n)}{\alpha^{p-1}(\alpha-1)}
\end{aligned}
$$

Thus, from (9) we have

$$
\sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{H}^{\left(w_{i}\right)}(n+1)\right|<S_{m}^{\langle\mathrm{Sf}\rangle}(n) \cdot\left(\mathcal{P}_{m}^{(p, q)}(1 / \alpha)+\frac{1}{\alpha^{p-1}(\alpha-1)}\right)
$$

Using this inequality together with equality (8) in (7), we obtain

$$
S_{m}^{\langle\mathrm{Sf}\rangle}(n+1)>S_{m}^{\langle\mathrm{Sf}\rangle}(n) \cdot\left(r-\mathcal{P}_{m}^{(p, q)}(1 / \alpha)-\frac{1}{\alpha^{p-1}(\alpha-1)}\right)
$$

Therefore, if $\alpha$ satisfy the inequality

$$
r-\mathcal{P}_{m}^{(p, q)}(1 / \alpha)-\frac{1}{\alpha^{p-1}(\alpha-1)} \geq \alpha
$$

we obtain inductively that the inequality $S_{m}^{\langle\mathrm{Sf}\rangle}(n+1) \geq \alpha S_{m}^{\langle\mathrm{Sf}\rangle}(n)$ holds for any $n$. Thus, in this case we have $S_{m}^{\langle\mathrm{Sf}\rangle}(n)=\Omega\left(\alpha^{n}\right)$. Since, obviously, the order of growth of $S^{\langle\mathrm{Sf}\rangle}(n)$ is not less than $S_{m}^{\langle\mathrm{Sf}\rangle}(n)$, we then conclude that $S^{\langle\mathrm{Sf}\rangle}(n)=\Omega\left(\alpha^{n}\right)$. Hence $\gamma^{\langle\mathrm{Sf}\rangle} \geq \alpha$.

For obtaining a concrete lower bound on $\gamma^{\langle\mathrm{Sf}\rangle}$ we take the parameters $m=45, p=52$, $q=60$. Using computer computations, we have obtained ${ }^{5}$ that $\left|\mathcal{F}^{\prime \prime}(45)\right|=277316$, the maximal in modulus eigenvalue $r$ for $\Delta_{45}$ is 1.302011, and all components of the eigenvector corresponding to $r$ are positive. Further, we obtained that

$$
\begin{gathered}
\mathcal{P}_{45}^{(52,60)}(z)=3.759479 \cdot z^{44}+3.176743 \cdot z^{45}+6.048526 \cdot z^{46}+ \\
7.120005 \cdot z^{48}+14.679230 \cdot z^{50}+41.594270 \cdot z^{52}+37.431675 \cdot z^{55}+ \\
40.471892 \cdot z^{56}+32.780085 \cdot z^{58}+5.235193 \cdot z^{59}+275.705551 \cdot z^{60}
\end{gathered}
$$

Let $\alpha=1.30173$. It is immediately checked that

$$
r-\mathcal{P}_{45}^{(52,60)}(1 / \alpha)-\frac{1}{\alpha^{51}(\alpha-1)} \geq \alpha
$$

Moreover, the inequalities $S_{45}^{\langle\mathrm{Sf}\rangle}(n+1) \geq \alpha S_{45}^{\langle\mathrm{Sf}\rangle}(n)$ for each $n=45,46, \ldots, q+m-1=104$ are verified in the same inductive way as described above with evident modifications following from the restriction $n<q+m$. Thus, we obtaine that $\gamma^{\langle\mathrm{Sf}\rangle} \geq 1.30173$.

## 3 Estimation for the number of minimally repetitive ternary words

For obtaining a lower bound on $\gamma^{\langle l f\rangle}$ we also consider words over $\Sigma_{3}$. Now denote by $\mathcal{F}$ the set of all minimally repetitive words from $\Sigma_{3}^{*}$. By a prohibited repetition we mean a word with an exponent greater than $7 / 4$. Let $m$ be a natural number, $m>2$. Analogously to the case of square-free words, we introduce also the notions of descendant, ancestor, and closed word for minimally repetitive words, and denote by $\mathcal{L}_{m}$ the set of all words from $\Sigma_{3}^{*}$ which do not contain closed words from $\mathcal{F}(m)$ as factors. Denote also by $\mathcal{F}_{m}$ the set of all minimally repetitive words from $\mathcal{L}_{m}$, by $\mathcal{F}^{\prime}(m)$ the set of all words $w$ from $\mathcal{F}(m)$ such that $w[1]=0$ and $w[2]=1$, and by $\mathcal{F}^{\prime \prime}(m)$ the set of all words from $\mathcal{F}^{\prime}(m)$ which are not closed. As in the case of square-free words, we introduce the notions of quasi-descendant and quasi-ancestor, define for $\mathcal{F}^{\prime \prime}(m)$ the matrix $\Delta_{m}$ of size $s \times s$ where $s=\left|\mathcal{F}^{\prime \prime}(m)\right|$, and compute the maximal in modulus eigenvalue $r$ of this matrix. If $r>1$ and all components of the eigenvector $\tilde{x}=\left(x_{1} ; \ldots ; x_{s}\right)$ corresponding to $r$ are positive, then we denote by $\mu$ the ratio $\max _{i} x_{i} / \min _{i} x_{i}$, and for $n \geq m$ consider $S_{m}^{\text {lf }\rangle}(n)=\sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{F}_{m}^{\left(w_{i}\right)}(n)\right|$ where $w_{i}$ is $i$-th word of the set $\mathcal{F}^{\prime \prime}(m), i=1, \ldots, s$.

Analogously to equality (1), for $i=1, \ldots, s$ we have

$$
\begin{equation*}
\left|\mathcal{F}_{m}^{\left(w_{i}\right)}(n+1)\right|=\left|\mathcal{G}^{\left(w_{i}\right)}(n+1)\right|-\left|\mathcal{H}^{\left(w_{i}\right)}(n+1)\right| \tag{15}
\end{equation*}
$$

[^3]where $\mathcal{G}^{\left(w_{i}\right)}(n+1)$ is the set of all words $w$ from $\mathcal{L}_{m}^{\left(w_{i}\right)}(n+1)$ such that the words $w[1: n]$ and $w[n-m+1: n+1]$ are minimally repetitive, and $\mathcal{H}^{\left(w_{i}\right)}(n+1)$ is the set of all words from $\mathcal{G}^{\left(w_{i}\right)}(n+1)$ which contain some prohibited repetition as a suffix. Analogously to equality (2), we can obtain
$$
\left|\mathcal{G}^{\left(w_{i}\right)}(n+1)\right|=\sum_{w \in \pi(i)}\left|\mathcal{F}_{m}^{(w)}(n)\right|
$$
where $\pi(i)$ is the set of all quasi-ancestors of $w_{i}$. For any word $w$ from $\mathcal{H}^{\left(w_{i}\right)}(n+1)$ denote by $\lambda(w)$ the minimal period of the shortest prohibited repetition which is a suffix of $w$. Then, analogously to equality (3),
$$
\left|\mathcal{H}^{\left(w_{i}\right)}(n+1)\right|=\sum_{\lfloor(4 m+3) / 7\rfloor<j \leq\lfloor 4 n / 7\rfloor}\left|\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)\right|,
$$
where $\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)$ is the set of all words $w$ from $\mathcal{H}^{\left(w_{i}\right)}(n+1)$ such that $\lambda(w)=j$. Take some integer $p \geq 4 m / 3-1$ and assume that $n>\lfloor 7 p / 4\rfloor$. Let $w$ be an arbitrary word from $\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)$ where $j \leq p$. Then the suffix $w[n-\lfloor 7 p / 4\rfloor+1: n+1]$ is a prohibited repetition which contains neither closed words from $\mathcal{F}(m)$ nor other prohibited repetitions as factors and contains the word $w_{i}$ as a suffix. Let $v_{1}, \ldots, v_{t}$ be all possible prohibited repetitions with minimal period $j$ which satisfy the given conditions. Denote by $\mathcal{H}_{j, k}^{\left(w_{i}\right)}(n+1)$ the set of all words from $\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)$ which contain $v_{k}$ as a suffix, $k=1, \ldots, t$. Let $w \in \mathcal{H}_{j, k}^{\left(w_{i}\right)}(n+1)$. Analogously to the case of square-free words, the symbol $w[n-\lfloor 7 j / 4\rfloor]$ is determined uniquely by $v_{k}$ as the symbol from $\Sigma_{3}$ which is different from the two distinct symbols $v_{k}[1]$ and $v_{k}[j]$. Denoting this symbol by $b_{k}$, we conclude that the factor $w[n-\lfloor 7 j / 4\rfloor: n]$ is determined uniquely as the word $b_{k} v_{k}[1:\lfloor 7 j / 4\rfloor]$. Let this word belong to $\mathcal{F}_{m}$. Then we denote by $u_{k}^{\prime}$ the word from $\mathcal{F}^{\prime}(m)$ which is isomorphic to the word $b_{k} v_{k}[1: m-1]$. Analogously to inequality (4), one can obtain the inequality
$$
\left|\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)\right| \leq \sum_{u \in U_{j}\left(w_{i}\right)}\left|\mathcal{F}_{m}^{(u)}(n+m-\lfloor 7 j / 4\rfloor-1)\right|
$$
where $U_{j}\left(w_{i}\right)$ is the set of all words ${ }^{6} u_{k}^{\prime}$. Thus,
\[

$$
\begin{equation*}
\left|\mathcal{H}^{\left(w_{i}\right)}(n+1)\right| \leq A_{p}^{\left(w_{i}\right)}(n+1)+\sum_{p<j \leq\lfloor 4 n / 7\rfloor}\left|\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)\right| \tag{16}
\end{equation*}
$$

\]

where

$$
A_{p}^{\left(w_{i}\right)}(n+1)=\sum_{\lfloor(4 m+3) / 7\rfloor<j \leq p}\left(\sum_{u \in U_{j}\left(w_{i}\right)}\left|\mathcal{F}_{m}^{(u)}(n+m-\lfloor 7 j / 4\rfloor-1)\right|\right) .
$$

From (15) and (16) we obtain that

$$
\begin{align*}
S_{m}^{\text {lff }\rangle}(n+1) \geq & \sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{G}^{\left(w_{i}\right)}(n+1)\right|-\sum_{i=1}^{s} x_{i} \cdot\left|A_{p}^{\left(w_{i}\right)}(n+1)\right|- \\
& \sum_{p<j \leq\lfloor 4 n / 7\rfloor}\left(\sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)\right|\right) \tag{17}
\end{align*}
$$

[^4]Analogously to equality (8), the equality

$$
\begin{equation*}
\sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{G}^{\left(w_{i}\right)}(n+1)\right|=r \cdot S_{m}^{\langle\mathrm{lf} \mathrm{\rangle}}(n) \tag{18}
\end{equation*}
$$

is valid. Let $j>p$, i.e., $j \geq 4 m / 3$. Note that the sets $\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)$ are non-overlapping. So we have the obvious inequality

$$
\begin{equation*}
\sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)\right| \leq\left|\mathcal{M}_{j}\right| \cdot \max _{i=1, \ldots, s} x_{i} \tag{19}
\end{equation*}
$$

where $\mathcal{M}_{j}=\bigcup_{i=1}^{s} \mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)$. Note also that any word $w$ from $\mathcal{M}_{j}$ is determined uniquely by the prefix $w[1: n-\lfloor 3 j / 4\rfloor]$ and satisfies the conditions $w[n+2-m-j]=w[n+2-m]=0$ and $w[n+3-m-j]=w[n+3-m]=1$. Thus $\left|\mathcal{M}_{j}\right| \leq\left|\mathcal{M}_{j}^{\prime}\right|$ where $\mathcal{M}_{j}^{\prime}$ is the set of all words $w$ from $\mathcal{F}_{m}(n-\lfloor 3 j / 4\rfloor)$ such that $w[n+2-m-j]=0$ and $w[n+3-m-j]=1$. Consider also the set $\mathcal{M}_{j}^{\prime \prime}$ of all words $w$ from $\mathcal{F}_{m}(n-\lfloor 3 j / 4\rfloor)$ such that $w[n+1-\lfloor 3 j / 4\rfloor-m\rfloor=0$ and $w[n+2-\lfloor 3 j / 4\rfloor-m\rfloor=1$. There is an evident bijection between the sets $\mathcal{M}_{j}^{\prime}$ and $\mathcal{M}_{j}^{\prime \prime}$, so $\left|\mathcal{M}_{j}^{\prime}\right|=\left|\mathcal{M}_{j}^{\prime \prime}\right|$. Note also that the set $\mathcal{M}_{j}^{\prime \prime}$ is the union of the non-overlapping sets $\mathcal{H}_{j}^{\left(w_{i}\right)}(n-\lfloor 3 j / 4\rfloor)$ for $i=1, \ldots, s$, i.e.,

$$
\left|\mathcal{M}_{j}^{\prime \prime}\right| \leq \sum_{i=1}^{s}\left|\mathcal{H}_{j}^{\left(w_{i}\right)}(n-\lfloor 3 j / 4\rfloor)\right| \leq S_{m}^{\langle\operatorname{lf}\rangle}(n-\lfloor 3 j / 4\rfloor) /\left(\min _{i=1, \ldots, s} x_{i}\right)
$$

Therefore, it follows from (19) that

$$
\sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)\right| \leq\left|\mathcal{M}_{j}^{\prime}\right| \cdot \max _{i=1, \ldots, s} x_{i}=\left|\mathcal{M}_{j}^{\prime \prime}\right| \cdot \max _{i=1, \ldots, s} x_{i} \leq \mu \cdot S_{m}^{\langle\mathrm{lf} \mathrm{\rangle}\rangle}(n-\lfloor 3 j / 4\rfloor)
$$

Thus,

$$
\begin{equation*}
\sum_{p<j \leq\lfloor 4 n / 7\rfloor}\left(\sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)\right|\right) \leq \mu \cdot \sum_{p<j \leq\lfloor 4 n / 7\rfloor} S_{m}^{\langle\backslash \mathrm{ff}\rangle}(n-\lfloor 3 j / 4\rfloor) . \tag{20}
\end{equation*}
$$

Let $\eta_{k}(j)=\sum_{i=1}^{s} x_{i} \cdot \zeta_{j}^{(k)}\left(w_{i}\right)$ where $\zeta_{j}^{(k)}\left(w_{i}\right)$ is the number of words $w_{k}$ in the set $U_{j}\left(w_{i}\right)$, $k=1, \ldots, s$. Then, analogously to equality (11),

$$
\begin{equation*}
\sum_{i=1}^{s} x_{i} \cdot\left|A_{p}^{\left(w_{i}\right)}(n+1)\right|=\sum_{\lfloor(4 m+3) / 7\rfloor<j \leq p} \sum_{k=1}^{s} \eta_{k}(j) \cdot\left|\mathcal{F}_{m}^{\left(w_{k}\right)}(n+m-\lfloor 7 j / 4\rfloor-1)\right| . \tag{21}
\end{equation*}
$$

Take some integer $q \geq\lfloor 7 p / 4\rfloor+1-m$ and assume that $n \geq q+m$. Analogously to the case of square-free words, sum (21) can be majorized by some sum $\sum_{d=d_{0}}^{q} \rho_{d} \cdot S_{m}(n-d)$ where $d_{0}=\left\lfloor 7 j_{0} / 4\right\rfloor+1-m$ for $j_{0}=\lfloor(4 m+3) / 7\rfloor+1$.

Let for some $\alpha>1$ and each $i=m, m+1, \ldots, n-1$ the inequality $S_{m}^{\text {〈lf }\rangle}(i+1) \geq \alpha S_{m}^{\langle\mathrm{lf} \mathrm{\rangle}}(i)$ be valid, i.e., $S_{m}^{\langle\mathrm{lf}\rangle}(i) \leq S_{m}^{\langle\mathrm{lf} \mathrm{\rangle}}(n) / \alpha^{n-i}$. Then

$$
\begin{equation*}
\sum_{i=1}^{s} x_{i} \cdot A_{p}^{\left(w_{i}\right)}(n+1) \leq \sum_{d=d_{0}}^{q} \rho_{d} \cdot\left(S_{m}^{\langle\mathrm{lf} \mathrm{\rangle}}(n) / \alpha^{d}\right)=\mathcal{P}_{m}^{(p, q)}(1 / \alpha) \cdot S_{m}^{\langle\mathrm{lf}\rangle}(n) \tag{22}
\end{equation*}
$$

where $\mathcal{P}_{m}^{(p, q)}(z)=\sum_{d=d_{0}}^{q} \rho_{d} \cdot z^{d}$. Moreover, it follows from (20) that

$$
\begin{gathered}
\sum_{p<j \leq\lfloor 4 n / 7\rfloor}\left(\sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)\right|\right) \leq \mu \cdot \sum_{p<j \leq\lfloor 4 n / 7\rfloor} S_{m}^{\langle\mathrm{lf} \mathrm{\rangle}}(n) / \alpha^{\lfloor 3 j / 4\rfloor} \\
<\mu S_{m}^{\langle\mathrm{lf}\rangle}(n) \cdot \sum_{p<j} 1 / \alpha^{\lfloor 3 j / 4\rfloor} \\
=\mu S_{m}^{\langle\mathrm{lf} \mathrm{\rangle}}(n) \cdot\left(\sum_{j \geq\lfloor 3(p+1) / 4\rfloor} 1 / \alpha^{j}+\sum_{j \geq\lceil(p+1) / 4\rceil} 1 / \alpha^{3 j}\right) \\
=\mu S_{m}^{\langle\mathrm{lf}\rangle}(n) \cdot\left(1 /\left(\alpha^{\lfloor(3 p-1) / 4\rfloor}(\alpha-1)\right)+1 /\left(\alpha^{3\lfloor p / 4\rfloor}\left(\alpha^{3}-1\right)\right)\right) .
\end{gathered}
$$

Thus, from inequality (17) together with relations (18) and (22) we obtain that

$$
\begin{aligned}
S_{m}^{\langle\mathrm{lf} \mathrm{\rangle}}(n+1)> & S_{m}^{\langle\mathrm{lf}\rangle}(n) \cdot\left(r-\mathcal{P}_{m}^{(p, q)}(1 / \alpha)-\right. \\
& \left.\mu \cdot\left(1 /\left(\alpha^{\lfloor(3 p-1) / 4\rfloor}(\alpha-1)\right)+1 /\left(\alpha^{3\lfloor p / 4\rfloor}\left(\alpha^{3}-1\right)\right)\right)\right)
\end{aligned}
$$

Therefore, if

$$
r-\mathcal{P}_{m}^{(p, q)}(1 / \alpha)-\mu \cdot\left(1 /\left(\alpha^{\lfloor(3 p-1) / 4\rfloor}(\alpha-1)\right)+1 /\left(\alpha^{3\lfloor p / 4\rfloor}\left(\alpha^{3}-1\right)\right)\right) \geq \alpha
$$

then $S_{m}^{\langle\mathrm{lf}\rangle}(n+1) \geq \alpha S_{m}^{\text {lf }\rangle}(n)$ for any $n$, i.e., $S_{m}^{\text {lf }\rangle}(n)=\Omega\left(\alpha^{n}\right)$. Since the order of growth of $S^{\langle\mathrm{lf}\rangle}(n)$ is not less than $S_{m}^{\langle\mathrm{lf}\rangle}(n)$, in this case we have $S^{\langle\mathrm{lf}\rangle}(n)=\Omega\left(\alpha^{n}\right)$, i.e., $\gamma^{\langle\mathrm{lf}\rangle} \geq \alpha$.

Using computer computations with the parameters $m=42, p=72, q=85$, we obtained that $\left|\mathcal{F}^{\prime \prime}(42)\right|=36141, r=1.247500$, all components of the eigenvector corresponding to $r$ were positive, and $\mathcal{P}_{42}^{(72,85)}(z)$ was

$$
\begin{aligned}
& 1.976268 \cdot z^{42}+1.148062 \cdot z^{44}+3.519576 \cdot z^{45}+1.741046 \cdot z^{47}+ \\
& 9.687624 \cdot z^{49}+0.126312 \cdot z^{50}+31.479339 \cdot z^{52}+12.284335 \cdot z^{53}+ \\
& 21.010557 \cdot z^{54}+24.183001 \cdot z^{56}+96.529327 \cdot z^{61}+129.216325 \cdot z^{64}+ \\
& 256.213310 \cdot z^{66}+14.826731 \cdot z^{67}+64.163103 \cdot z^{68}+6.862805 \cdot z^{69}+ \\
& 84.819931 \cdot z^{70}+2.337610 \cdot z^{72}+175.026144 \cdot z^{73}+41.068102 \cdot z^{74}+ \\
& 335.714818 \cdot z^{75}+341.576384 \cdot z^{78}+329.970329 \cdot z^{80}+693.282157 \cdot z^{81}+ \\
& 763.104210 \cdot z^{82}+303.272754 \cdot z^{83}+583.157071 \cdot z^{84}+10510.070498 \cdot z^{85} .
\end{aligned}
$$

Let $\alpha=1.245$. It is immediately checked that

$$
r-\mathcal{P}_{42}^{(72,85)}(1 / \alpha)-\frac{1}{\alpha^{53}(\alpha-1)}-\frac{1}{\alpha^{54}\left(\alpha^{3}-1\right)} \geq \alpha
$$

Moreover, we estimate $S_{42}^{\langle\mathrm{lf} \mathrm{\rangle}}(n+1) \geq \alpha S_{42}^{\text {lf }\rangle}(n)$ for each $n=42,43, \ldots, q+m-1=126$ in the same inductive way with evident modifications following from the restriction $n<q+m$. Thus we obtain that $\left.\gamma^{\langle\mathrm{f}}\right\rangle \geq 1.245$.

## 4 Estimation for the number of binary cube-free words

To obtain a lower bound on $\gamma^{\langle\mathrm{Cf}}$, we consider the alphabet $\Sigma_{2}=\{0,1\}$. Denote by $\mathcal{F}$ the set of all cube-free words from $\Sigma_{2}^{*}$. Analogously to the case of square-free words, for any natural number $m>2$ we can introduce the notions of descendant, ancestor, and closed word for cube-free words. Denote also by $\mathcal{L}_{m}$ the set of all words from $\Sigma_{2}^{*}$ which do not contain closed words from $\mathcal{F}(m)$ as factors, and by $\mathcal{F}_{m}$ the set of all cube-free words from $\mathcal{L}_{m}$. By $\mathcal{F}^{\prime}(m)$ we denote the set of all words $w$ from $\mathcal{F}(m)$ such that $w[1]=0$. Note that for any word $w$ from $\mathcal{F}(m)$ there exists a single word from $\mathcal{F}^{\prime}(m)$ which is isomorphic to $w$. By $\mathcal{F}^{\prime \prime}(m)$ we denote the set of all words from $\mathcal{F}^{\prime}(m)$ which are not closed. We introduce also the notions of quasi-descendant and quasi-ancestor, define for $\mathcal{F}^{\prime \prime}(m)$ the matrix $\Delta_{m}$ of size $s \times s$ where $s=\left|\mathcal{F}^{\prime \prime}(m)\right|$, and compute the maximal in modulus eigenvalue $r$ of this matrix. If $r>1$ and all components of the eigenvector $\tilde{x}=\left(x_{1} ; \ldots ; x_{s}\right)$ corresponding to $r$ are positive, then for $n \geq m$ we consider $S_{m}^{\langle\mathrm{cf} \mathrm{\rangle}}(n)=\sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{F}_{m}^{\left(w_{i}\right)}(n)\right|$ where $w_{i}$ is $i$-th word of the set $\mathcal{F}^{\prime \prime}(m)$, $i=1, \ldots, s$.

As in the case of square-free words, for $i=1, \ldots, s$ we have

$$
\begin{equation*}
\left|\mathcal{F}_{m}^{\left(w_{i}\right)}(n+1)\right|=\left|\mathcal{G}^{\left(w_{i}\right)}(n+1)\right|-\left|\mathcal{H}^{\left(w_{i}\right)}(n+1)\right| \tag{23}
\end{equation*}
$$

where $\mathcal{G}^{\left(w_{i}\right)}(n+1)$ is the set of all words $w$ from $\mathcal{L}_{m}^{\left(w_{i}\right)}(n+1)$ such that the words $w[1: n]$ and $w[n-m+1: n+1]$ are cube-free, and $\mathcal{H}^{\left(w_{i}\right)}(n+1)$ is the set of all words from $\mathcal{G}^{\left(w_{i}\right)}(n+1)$ which contain some cube as a suffix. Analogously to equality (2), we obtain

$$
\left|\mathcal{G}^{\left(w_{i}\right)}(n+1)\right|=\sum_{w \in \pi(i)}\left|\mathcal{F}_{m}^{(w)}(n)\right|
$$

where $\pi(i)$ is the set of all quasi-ancestors of $w_{i}$. For any word $w$ from $\mathcal{H}^{\left(w_{i}\right)}(n+1)$ denote by $\lambda(w)$ the period of the minimal cube which is a suffix of $w$. Then, analogously to equality (3),

$$
\begin{equation*}
\left|\mathcal{H}^{\left(w_{i}\right)}(n+1)\right|=\sum_{\lfloor(m+1) / 3\rfloor<j \leq\lfloor(n+1) / 3\rfloor}\left|\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)\right|, \tag{24}
\end{equation*}
$$

where $\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)$ is the set of all words $w$ from $\mathcal{H}^{\left(w_{i}\right)}(n+1)$ such that $\lambda(w)=j$. Take some integer $p \geq m$ and assume that $n \geq 3 p$. Let $w$ be an arbitrary word from $\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)$ where $j \leq p$. Then the suffix $w[n-3 j+2: n+1]$ is a cube which contains neither closed words from $\mathcal{F}(m)$ nor other cubes as factors and contains the word $w_{i}$ as a suffix. Let $v_{1}, \ldots, v_{t}$ be all possible cubes of period $j$ which satisfy the given conditions. Denote by $\mathcal{H}_{j, k}^{\left(w_{i}\right)}(n+1)$ the set of all words from $\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)$ which contain the cube $v_{k}$ as a suffix, $k=1, \ldots, t$. Let $w \in \mathcal{H}_{j, k}^{\left(w_{i}\right)}(n+1)$. Since the prefix $w[1: n]$ is cube-free, in this case we have $w[n-3 j+1] \neq w[n-2 j+1]=v_{k}[j]$. Thus, the symbol $w[n-3 j+1]$ is determined uniquely by $v_{k}$ as the symbol from $\Sigma_{2}$ which is different from $v_{k}[j]$. Denoting this symbol by $b_{k}$, we conclude that $v_{k}$ determines uniquely the factor $w[n-3 j+1: n]$ as the word $b_{k} v_{k}[1: 3 j-1]$. If this word is cube-free and does not contain closed words from $\mathcal{F}(m)$ as factors then we denote by $u_{k}^{\prime}$ the word from $\mathcal{F}^{\prime}(m)$ which is isomorphic to $w[n-3 j+1: n-3 j+m]$.

Analogously to inequality (4), one can obtain the inequality

$$
\begin{equation*}
\left|\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)\right| \leq \sum_{u \in U_{j}\left(w_{i}\right)}\left|\mathcal{F}_{m}^{(u)}(n-3 j+m)\right| \tag{25}
\end{equation*}
$$

where $U_{j}\left(w_{i}\right)$ is the set of all words ${ }^{7} u_{k}^{\prime}$. For $j>p$, analogously to inequality (5), we have

$$
\begin{equation*}
\left|\mathcal{H}_{j}^{\left(w_{i}\right)}(n+1)\right| \leq\left|\mathcal{F}_{m}^{\left(w_{i}\right)}(n-2 j+1)\right| . \tag{26}
\end{equation*}
$$

Thus, from (24), (25) and (26) we obtain that

$$
\begin{equation*}
\left|\mathcal{H}^{\left(w_{i}\right)}(n+1)\right| \leq A_{p}^{\left(w_{i}\right)}(n+1)+B_{p}^{\left(w_{i}\right)}(n+1) \tag{27}
\end{equation*}
$$

where

$$
\begin{aligned}
A_{p}^{\left(w_{i}\right)}(n+1) & =\sum_{\lfloor(m+1) / 3\rfloor<j \leq p}\left(\sum_{u \in U_{j}\left(w_{i}\right)}\left|\mathcal{F}_{m}^{(u)}(n-3 j+m)\right|\right), \\
B_{p}^{\left(w_{i}\right)}(n+1) & =\sum_{p<j \leq\lfloor(n+1) / 3\rfloor}\left|\mathcal{F}_{m}^{\left(w_{i}\right)}(n-2 j+1)\right| .
\end{aligned}
$$

Moreover, analogously to equalities (8) and (10), the equalities

$$
\begin{equation*}
\sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{G}^{\left(w_{i}\right)}(n+1)\right|=r \cdot S_{m}^{\langle\mathrm{cf}\rangle}(n) \tag{28}
\end{equation*}
$$

and

$$
\begin{equation*}
\sum_{i=1}^{s} x_{i} \cdot B_{p}^{\left(w_{i}\right)}(n+1)=\sum_{p<j \leq\lfloor(n+1) / 3\rfloor} S_{m}^{\langle\mathrm{cf} \mathrm{\rangle}\rangle}(n-2 j+1) \tag{29}
\end{equation*}
$$

hold. Let $\eta_{k}(j)=\sum_{i=1}^{s} x_{i} \cdot \zeta_{j}^{(k)}\left(w_{i}\right)$ where $\zeta_{j}^{(k)}\left(w_{i}\right)$ is the number of words $w_{k}$ in the set $U_{j}\left(w_{i}\right), k=1, \ldots, s$. Then, analogously to equality (11),

$$
\begin{equation*}
\sum_{i=1}^{s} x_{i} \cdot A_{p}^{\left(w_{i}\right)}(n+1)=\sum_{\lfloor(m+1) / 3\rfloor<j \leq p} \sum_{k=1}^{s} \eta_{k}(j) \cdot\left|\mathcal{F}_{m}^{\left(w_{k}\right)}(n-3 j+m)\right| . \tag{30}
\end{equation*}
$$

Take some integer $q \geq 3 p-m$ and assume that $n \geq q+m$. Analogously to the case of square-free words, sum (30) can be majorized by some sum $\sum_{d=d_{0}}^{q} \rho_{d} \cdot S_{m}^{\langle\mathrm{cf}\rangle}(n-d)$ where $d_{0}=3 \cdot\lfloor(m+4) / 3\rfloor-m$.

Let for some $\alpha>1$ and each $i=m, m+1, \ldots, n-1$ the inequalities $S_{m}^{\langle\mathrm{Cf}\rangle}(i+1) \geq \alpha S_{m}^{\langle\mathrm{Cf}\rangle}(i)$ be valid. Then

$$
\sum_{i=1}^{s} x_{i} \cdot A_{p}^{\left(w_{i}\right)}(n+1) \leq \sum_{d=d_{0}}^{q} \rho_{d} \cdot\left(S_{m}^{\langle\mathrm{cf}\rangle}(n) / \alpha^{d}\right)=\mathcal{P}_{m}^{(p, q)}(1 / \alpha) \cdot S_{m}^{\langle\mathrm{Cf}\rangle}(n)
$$

[^5]where $\mathcal{P}_{m}^{(p, q)}(z)=\sum_{d=d_{0}}^{q} \rho_{d} \cdot z^{d}$. Moreover, it follows from (29) that
$$
\sum_{i=1}^{s} x_{i} \cdot B_{p}^{\left(w_{i}\right)}(n+1) \leq \sum_{p<j \leq\lfloor(n+1) / 3\rfloor} \frac{S_{m}^{\langle\mathrm{Cf}\rangle}(n)}{\alpha^{2 j-1}}<\sum_{j=p}^{\infty} \frac{S_{m}^{\langle\mathrm{Cf}\rangle}(n)}{\alpha^{2 j+1}}=\frac{S_{m}^{\langle\mathrm{Cf}\rangle}(n)}{\alpha^{2 p-1}\left(\alpha^{2}-1\right)}
$$

Thus, from (27) we have

$$
\begin{aligned}
\sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{H}^{\left(w_{i}\right)}(n+1)\right| & \leq \sum_{i=1}^{s} x_{i} \cdot A_{p}^{\left(w_{i}\right)}(n+1)+\sum_{i=1}^{s} x_{i} \cdot B_{p}^{\left(w_{i}\right)}(n+1) \\
& <S_{m}^{\langle\mathrm{Cf}\rangle}(n) \cdot\left(\mathcal{P}_{m}^{(p, q)}(1 / \alpha)+\frac{1}{\alpha^{2 p-1}\left(\alpha^{2}-1\right)}\right)
\end{aligned}
$$

Using this inequality and equalities (23) and (28), we obtain

$$
\begin{aligned}
S_{m}^{\langle\mathrm{Cf}\rangle}(n+1) & =\sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{G}^{\left(w_{i}\right)}(n+1)\right|-\sum_{i=1}^{s} x_{i} \cdot\left|\mathcal{H}^{\left(w_{i}\right)}(n+1)\right| \\
& >S_{m}^{\langle\mathrm{Cf}\rangle}(n) \cdot\left(r-\mathcal{P}_{m}^{(p, q)}(1 / \alpha)-\frac{1}{\alpha^{2 p-1}\left(\alpha^{2}-1\right)}\right) .
\end{aligned}
$$

Therefore, if

$$
r-\mathcal{P}_{m}^{(p, q)}(1 / \alpha)-\frac{1}{\alpha^{2 p-1}\left(\alpha^{2}-1\right)} \geq \alpha
$$

then $S_{m}^{\langle\mathrm{cf}\rangle}(n+1) \geq \alpha S_{m}^{\langle\mathrm{cf}\rangle}(n)$ for any $n$, i. e. $S_{m}^{\langle\mathrm{cf}\rangle}(n)=\Omega\left(\alpha^{n}\right)$. Since the order of growth of $S^{\langle\mathrm{Cf}\rangle}(n)$ is not less than $S_{m}^{\langle\mathrm{Cf}\rangle}(n)$, we obtain in this case that $S^{\langle\mathrm{Cf}\rangle}(n)=\Omega\left(\alpha^{n}\right)$, i. e. $\gamma^{\langle\mathrm{cf}\rangle} \geq \alpha$.

Using computer computations with the parameters $m=35, p=35, q=70$, we obtained that $\left|\mathcal{F}^{\prime \prime}(35)\right|=732274, r=1.457599$, all components of the eigenvector corresponding to $r$ were positive, and $\mathcal{P}_{35}^{(35,70)}(z)$ was

$$
\begin{aligned}
& 0.890340 \cdot z^{35}+1.398382 \cdot z^{37}+1.096456 \cdot z^{38}+30.292784 \cdot z^{40}+ \\
& 2.533687 \cdot z^{41}+1.296919 \cdot z^{42}+28.893958 \cdot z^{43}+22.780262 \cdot z^{44}+ \\
& 10.699704 \cdot z^{45}+64.314464 \cdot z^{47}+92.853910 \cdot z^{49}+91.743094 \cdot z^{50}+ \\
& 67.688387 \cdot z^{51}+48.613345 \cdot z^{52}+68.285930 \cdot z^{53}+113.239316 \cdot z^{54}+ \\
& 144.612325 \cdot z^{56}+346.136318 \cdot z^{58}+173.468149 \cdot z^{59}+465.000388 \cdot z^{60}+ \\
& 134.993653 \cdot z^{61}+224.831969 \cdot z^{62}+585.928351 \cdot z^{63}+355.591901 \cdot z^{65}+ \\
& 1335.518621 \cdot z^{67}+343.074473 \cdot z^{68}+2202.468159 \cdot z^{69}+11098.126369 \cdot z^{70} .
\end{aligned}
$$

It is immediately checked that for $\alpha=1.457567$ the inequality

$$
r-\mathcal{P}_{35}^{(35,70)}(1 / \alpha)-\frac{1}{\alpha^{69}\left(\alpha^{2}-1\right)} \geq \alpha
$$

is valid. Moreover, the inequalities $S_{35}^{\langle\mathrm{cf}\rangle}(n+1) \geq \alpha S_{35}^{\langle\mathrm{Cf}\rangle}(n)$ for $n=35,36, \ldots, q+m-1=104$ are also verified in the same inductive way with evident modifications following from the restriction $n<q+m$. Thus $\gamma^{\langle\mathrm{Cf}\rangle} \geq 1.457567$.

## 5 Conclusions

Basing on results of computer experiments, we believe that by increasing the parameter $m$, one can estimate $\gamma^{\langle\mathrm{Sf}\rangle}$, $\gamma^{\langle\mathrm{lf}\rangle}$, and $\gamma^{\langle\mathrm{Cf}\rangle}$ with an arbitrarily high precision. Note also that the proposed method for estimation of growth rates of repetition-free words is quite general: it can be applyed for estimating the growth rate of words over any finite alphabet with any (including fractional) minimal threshold for exponents of prohibited factors (provided that the growth is exponential). Moreover, this method can be easily modified for the case when additional restrictions are imposed on the minimal value of periods of prohibited factors (see [11]). We suppose that this method can be also generalized for estimation of growth rates of words avoiding patterns (see, e.g., [6]).
